15 March 2007 – 728 pages

Part I: Theory of Neutrino Masses and Mixing

- Dirac Neutrino Masses
- Majorana Neutrino Masses
- Dirac-Majorana Mass Term

Part II: Neutrino Oscillations in Vacuum and in Matter

- Neutrino Oscillations in Vacuum
- CPT, CP and T Symmetries
- Two-Neutrino Oscillations
- Neutrino Oscillations in Matter

Part III: Experimental Results and Theoretical Implications

- Solar Neutrinos and KamLAND
- Atmospheric and LBL Oscillation Experiments
- Phenomenology of Three-Neutrino Mixing
- Tritium Beta-Decay
- Neutrinoless Double-Beta Decay
- Cosmological Bound on Neutrino Masses
- Experimental Neutrino Anomalies
- Conclusions

Part I

Theory of Neutrino Masses and Mixing

Dirac Neutrino Masses

- Dirac Neutrino Masses
 - Dirac Mass
 - Higgs Mechanism in SM
 - Dirac Lepton Masses
 - Three-Generations Dirac Neutrino Masses
 - Massive Chiral Lepton Fields
 - Massive Dirac Lepton Fields
 - Quantization
 - Mixing
 - Flavor Lepton Numbers
 - Total Lepton Number
 - Mixing Matrix
 - Standard Parameterization of Mixing Matrix
 - CP Violation
 - Example: $\vartheta_{12} = 0$
 - Example: $\vartheta_{13} = \pi/2$
 - Example: $m_{\nu_2} = m_{\nu_3}$

Dirac Mass

- ▶ Dirac Equation: $(i\partial - m)\nu(x) = 0 \quad (\partial \equiv \gamma^\mu \partial_\mu)$
- ▶ Dirac Lagrangian: $\mathcal{L}(x) = \bar{\nu}(x)(i\partial - m)\nu(x)$
- ▶ Chiral decomposition: $\nu_L \equiv \frac{1 - \gamma^5}{2}\nu, \quad \nu_R \equiv \frac{1 + \gamma^5}{2}\nu$
$$\nu = \nu_L + \nu_R$$
$$\mathcal{L} = \bar{\nu}_L i\partial \nu_L + \bar{\nu}_R i\partial \nu_R - m(\bar{\nu}_L \nu_R + \bar{\nu}_R \nu_L)$$
- ▶ In SM only $\nu_L \implies$ no Dirac mass
- ▶ Oscillation experiments have shown that neutrinos are massive
- ▶ Simplest extension of the SM: add ν_R

Higgs Mechanism in SM

- ▶ SM: fermion masses are generated through the Higgs mechanism
- ▶ Higgs Doublet: $\Phi(x) = \begin{pmatrix} \phi^+(x) \\ \phi^0(x) \end{pmatrix}$
- ▶ Higgs Lagrangian: $\mathcal{L}_{\text{Higgs}} = (D_\mu \Phi)^\dagger (D^\mu \Phi) - V(\Phi)$
- ▶ Higgs Potential: $V(\Phi) = \mu^2 \Phi^\dagger \Phi + \lambda (\Phi^\dagger \Phi)^2$
- ▶ $\mu^2 < 0, \lambda > 0 \implies V(\Phi) = \lambda \left(\Phi^\dagger \Phi - \frac{v^2}{2} \right)^2$, with $v \equiv \sqrt{-\frac{\mu^2}{\lambda}}$
- ▶ Vacuum: V_{\min} for $\Phi^\dagger \Phi = \frac{v^2}{2} \implies \langle \Phi \rangle = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v \end{pmatrix}$
- ▶ Spontaneous Symmetry Breaking: $SU(2)_L \times U(1)_Y \rightarrow U(1)_Q$
- ▶ Unitary Gauge: $\Phi(x) = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v + H(x) \end{pmatrix}$

Dirac Lepton Masses

$$L_L \equiv \begin{pmatrix} \nu_L \\ \ell_L \end{pmatrix} \quad \ell_R \quad \nu_R$$

Lepton-Higgs Yukawa Lagrangian

$$\mathcal{L}_{H,L} = -y^\ell \overline{\ell_L} \Phi \ell_R - y^\nu \overline{\nu_L} \tilde{\Phi} \nu_R + \text{H.c.}$$

Unitary Gauge

$$\Phi(x) = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v + H(x) \end{pmatrix} \quad \tilde{\Phi} = i\tau_2 \Phi^* = \frac{1}{\sqrt{2}} \begin{pmatrix} v + H(x) \\ 0 \end{pmatrix}$$

$$\begin{aligned} \mathcal{L}_{H,L} = & -\frac{y^\ell}{\sqrt{2}} \begin{pmatrix} \overline{\nu_L} & \overline{\ell_L} \end{pmatrix} \begin{pmatrix} 0 \\ v + H(x) \end{pmatrix} \ell_R \\ & -\frac{y^\nu}{\sqrt{2}} \begin{pmatrix} \overline{\nu_L} & \overline{\ell_L} \end{pmatrix} \begin{pmatrix} v + H(x) \\ 0 \end{pmatrix} \nu_R + \text{H.c.} \end{aligned}$$

$$\begin{aligned}\mathcal{L}_{H,L} = & -y^\ell \frac{v}{\sqrt{2}} \overline{\ell}_L \ell_R - y^\nu \frac{v}{\sqrt{2}} \overline{\nu}_L \nu_R \\ & - \frac{y^\ell}{\sqrt{2}} \overline{\ell}_L \ell_R H - \frac{y^\nu}{\sqrt{2}} \overline{\nu}_L \nu_R H + \text{H.c.}\end{aligned}$$

$$m_\ell = y^\ell \frac{v}{\sqrt{2}}$$

$$m_\nu = y^\nu \frac{v}{\sqrt{2}}$$

$$g_{\ell H} = \frac{y^\ell}{\sqrt{2}} = \frac{m_\ell}{v}$$

$$g_{\nu H} = \frac{y^\nu}{\sqrt{2}} = \frac{m_\nu}{v}$$

Three-Generations Dirac Neutrino Masses

$L'_{eL} \equiv \begin{pmatrix} \nu'_{eL} \\ \ell'_{eL} \equiv e'_L \end{pmatrix}$	$L'_{\mu L} \equiv \begin{pmatrix} \nu'_{\mu L} \\ \ell'_{\mu L} \equiv \mu'_L \end{pmatrix}$	$L'_{\tau L} \equiv \begin{pmatrix} \nu'_{\tau L} \\ \ell'_{\tau L} \equiv \tau'_L \end{pmatrix}$
$\ell'_{eR} \equiv e'_R$	$\ell'_{\mu R} \equiv \mu'_R$	$\ell'_{\tau R} \equiv \tau'_R$
ν'_{eR}	$\nu'_{\mu R}$	$\nu'_{\tau R}$

Lepton-Higgs Yukawa Lagrangian

$$\mathcal{L}_{H,L} = - \sum_{\alpha,\beta=e,\mu,\tau} \left[Y_{\alpha\beta}^{\ell\ell} \overline{L'_{\alpha L}} \Phi \ell'_{\beta R} + Y_{\alpha\beta}^{\ell\nu} \overline{L'_{\alpha L}} \tilde{\Phi} \nu'_{\beta R} \right] + \text{H.c.}$$

Unitary Gauge

$$\Phi(x) = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v + H(x) \end{pmatrix} \quad \tilde{\Phi} = i\tau_2 \Phi^* = \frac{1}{\sqrt{2}} \begin{pmatrix} v + H(x) \\ 0 \end{pmatrix}$$

$$\mathcal{L}_{H,L} = - \left(\frac{v + H}{\sqrt{2}} \right) \sum_{\alpha, \beta = e, \mu, \tau} \left[Y'^{\ell}_{\alpha\beta} \overline{\ell'_{\alpha L}} \ell'_{\beta R} + Y'^{\nu}_{\alpha\beta} \overline{\nu'_{\alpha L}} \nu'_{\beta R} \right] + \text{H.c.}$$

$$\mathcal{L}_{H,L} = - \left(\frac{v + H}{\sqrt{2}} \right) \left[\overline{\ell'_L} Y'^{\ell} \ell'_R + \overline{\nu'_L} Y'^{\nu} \nu'_R \right] + \text{H.c.}$$

$$\ell'_L \equiv \begin{pmatrix} e'_L \\ \mu'_L \\ \tau'_L \end{pmatrix} \quad \ell'_R \equiv \begin{pmatrix} e'_R \\ \mu'_R \\ \tau'_R \end{pmatrix} \quad \nu'_L \equiv \begin{pmatrix} \nu'_{eL} \\ \nu'_{\mu L} \\ \nu'_{\tau L} \end{pmatrix} \quad \nu'_R \equiv \begin{pmatrix} \nu'_{eR} \\ \nu'_{\mu R} \\ \nu'_{\tau R} \end{pmatrix}$$

$$Y'^{\ell} \equiv \begin{pmatrix} Y'^{\ell}_{ee} & Y'^{\ell}_{e\mu} & Y'^{\ell}_{e\tau} \\ Y'^{\ell}_{\mu e} & Y'^{\ell}_{\mu\mu} & Y'^{\ell}_{\mu\tau} \\ Y'^{\ell}_{\tau e} & Y'^{\ell}_{\tau\mu} & Y'^{\ell}_{\tau\tau} \end{pmatrix} \quad Y'^{\nu} \equiv \begin{pmatrix} Y'^{\nu}_{ee} & Y'^{\nu}_{e\mu} & Y'^{\nu}_{e\tau} \\ Y'^{\nu}_{\mu e} & Y'^{\nu}_{\mu\mu} & Y'^{\nu}_{\mu\tau} \\ Y'^{\nu}_{\tau e} & Y'^{\nu}_{\tau\mu} & Y'^{\nu}_{\tau\tau} \end{pmatrix}$$

$$M'^{\ell} = \frac{v}{\sqrt{2}} Y'^{\ell} \quad M'^{\nu} = \frac{v}{\sqrt{2}} Y'^{\nu}$$

$$\mathcal{L}_{H,L} = - \left(\frac{v + H}{\sqrt{2}} \right) \left[\overline{\ell_L'} Y^{\prime\ell} \ell_R' + \overline{\nu_L'} Y^{\prime\nu} \nu_R' \right] + \text{H.c.}$$

Diagonalization of $Y^{\prime\ell}$ and $Y^{\prime\nu}$ with unitary V_L^ℓ , V_R^ℓ , V_L^ν , V_R^ν

$$\ell_L' = V_L^\ell \ell_L \quad \ell_R' = V_R^\ell \ell_R \quad \nu_L' = V_L^\nu \mathbf{n}_L \quad \nu_R' = V_R^\nu \mathbf{n}_R$$

Kinetic terms are invariant under unitary transformations of the fields

$$\mathcal{L}_{H,L} = - \left(\frac{v + H}{\sqrt{2}} \right) \left[\overline{\ell_L} V_L^{\ell\dagger} Y^{\prime\ell} V_R^\ell \ell_R + \overline{\nu_L} V_L^{\nu\dagger} Y^{\prime\nu} V_R^\nu \nu_R \right] + \text{H.c.}$$

$$V_L^{\ell\dagger} Y^{\prime\ell} V_R^\ell = Y^\ell \quad Y_{\alpha\beta}^\ell = y_\alpha^\ell \delta_{\alpha\beta} \quad (\alpha, \beta = e, \mu, \tau)$$

$$V_L^{\nu\dagger} Y^{\prime\nu} V_R^\nu = Y^\nu \quad Y_{kj}^\nu = y_k^\nu \delta_{kj} \quad (k, j = 1, 2, 3)$$

Real and Positive y_α^ℓ , y_k^ν

$$\begin{array}{ccc}
 V_L^\dagger Y' V_R = Y & \iff & Y' = V_L Y V_R^\dagger \\
 2N^2 & & N^2 \quad N \quad N^2 \\
 18 & & 9 \quad 3 \quad 9
 \end{array}$$

Massive Chiral Lepton Fields

$\ell_L = V_L^{\ell\dagger} \ell'_L \equiv \begin{pmatrix} e_L \\ \mu_L \\ \tau_L \end{pmatrix}$	$\ell_R = V_R^{\ell\dagger} \ell'_R \equiv \begin{pmatrix} e_R \\ \mu_R \\ \tau_R \end{pmatrix}$
$n_L = V_L^{\nu\dagger} \nu'_L \equiv \begin{pmatrix} \nu_{1L} \\ \nu_{2L} \\ \nu_{3L} \end{pmatrix}$	$n_R = V_R^{\nu\dagger} \nu'_R \equiv \begin{pmatrix} \nu_{1R} \\ \nu_{2R} \\ \nu_{3R} \end{pmatrix}$

$$\begin{aligned}\mathcal{L}_{H,L} &= - \left(\frac{v + H}{\sqrt{2}} \right) \left[\overline{\ell_L} Y^\ell \ell_R + \overline{n_L} Y^\nu n_R \right] + \text{H.c.} \\ &= - \left(\frac{v + H}{\sqrt{2}} \right) \left[\sum_{\alpha=e,\mu,\tau} y_\alpha^\ell \overline{\ell_{\alpha L}} \ell_{\alpha R} + \sum_{k=1}^3 y_k^\nu \overline{\nu_{kL}} \nu_{kR} \right] + \text{H.c.}\end{aligned}$$

Massive Dirac Lepton Fields

$$\ell_\alpha \equiv \ell_{\alpha L} + \ell_{\alpha R} \quad (\alpha = e, \mu, \tau)$$

$$\nu_k = \nu_{kL} + \nu_{kR} \quad (k = 1, 2, 3)$$

$$\begin{aligned}\mathcal{L}_{H,L} = & - \sum_{\alpha=e,\mu,\tau} \frac{y_\alpha^\ell v}{\sqrt{2}} \overline{\ell_\alpha} \ell_\alpha - \sum_{k=1}^3 \frac{y_k^\nu v}{\sqrt{2}} \overline{\nu_k} \nu_k && \text{Mass Terms} \\ & - \sum_{\alpha=e,\mu,\tau} \frac{y_\alpha^\ell}{\sqrt{2}} \overline{\ell_\alpha} \ell_\alpha H - \sum_{k=1}^3 \frac{y_k^\nu}{\sqrt{2}} \overline{\nu_k} \nu_k H && \text{Lepton-Higgs Couplings}\end{aligned}$$

Charged Lepton and Neutrino Masses

$$m_\alpha = \frac{y_\alpha^\ell v}{\sqrt{2}} \quad (\alpha = e, \mu, \tau) \qquad m_k = \frac{y_k^\nu v}{\sqrt{2}} \quad (k = 1, 2, 3)$$

Lepton-Higgs coupling \propto Lepton Mass

Quantization

$$\nu_k(x) = \int \frac{d^3 p}{(2\pi)^3 2E_k} \sum_{h=\pm 1} \left[a_k^{(h)}(p) u_k^{(h)}(p) e^{-ip \cdot x} + b_k^{(h)\dagger}(p) v_k^{(h)}(p) e^{ip \cdot x} \right]$$

$$p^0 = E_k = \sqrt{\vec{p}^2 + m_k^2}$$
$$(\not{p} - m_k) u_k^{(h)}(p) = 0$$
$$(\not{p} + m_k) v_k^{(h)}(p) = 0$$

$$\frac{\vec{p} \cdot \vec{\Sigma}}{|\vec{p}|} u_k^{(h)}(p) = h u_k^{(h)}(p)$$

$$\frac{\vec{p} \cdot \vec{\Sigma}}{|\vec{p}|} v_k^{(h)}(p) = -h v_k^{(h)}(p)$$

$$\{a_k^{(h)}(p), a_k^{(h')\dagger}(p')\} = \{b_k^{(h)}(p), b_k^{(h')\dagger}(p')\} = (2\pi)^3 2E_k \delta^3(\vec{p} - \vec{p}') \delta_{hh'}$$
$$\{a_k^{(h)}(p), a_k^{(h')}(p')\} = \{a_k^{(h)\dagger}(p), a_k^{(h')\dagger}(p')\} = 0$$
$$\{b_k^{(h)}(p), b_k^{(h')}(p')\} = \{b_k^{(h)\dagger}(p), b_k^{(h')\dagger}(p')\} = 0$$
$$\{a_k^{(h)}(p), b_k^{(h')}(p')\} = \{a_k^{(h)\dagger}(p), b_k^{(h')\dagger}(p')\} = 0$$
$$\{a_k^{(h)}(p), b_k^{(h')\dagger}(p')\} = \{a_k^{(h)\dagger}(p), b_k^{(h')}(p')\} = 0$$

Mixing

Charged-Current Weak Interaction Lagrangian

$$\mathcal{L}_I^{(CC)} = -\frac{g}{2\sqrt{2}} j_W^\rho W_\rho + \text{H.c.}$$

Weak Charged Current: $j_W^\rho = j_{W,L}^\rho + j_{W,Q}^\rho$

Leptonic Weak Charged Current

$$j_{W,L}^\rho = \sum_{\alpha=e,\mu,\tau} \overline{\nu'_\alpha} \gamma^\rho (1 - \gamma^5) \ell'_\alpha = 2 \sum_{\alpha=e,\mu,\tau} \overline{\nu'_{\alpha L}} \gamma^\rho \ell'_{\alpha L} = 2 \overline{\nu'_L} \gamma^\rho \ell'_L$$

$$\ell'_L = V_L^\ell \ell_L \quad \nu'_L = V_L^\nu \mathbf{n}_L$$

$$j_{W,L}^\rho = 2 \overline{\mathbf{n}_L} V_L^{\nu\dagger} \gamma^\rho V_L^\ell \ell_L = 2 \overline{\mathbf{n}_L} V_L^{\nu\dagger} V_L^\ell \gamma^\rho \ell_L = 2 \overline{\mathbf{n}_L} U^\dagger \gamma^\rho \ell_L$$

Mixing Matrix

$$U^\dagger = V_L^{\nu\dagger} V_L^\ell \quad U = V_L^{\ell\dagger} V_L^\nu$$

► Definition: Left-Handed Flavor Neutrino Fields

$$\nu_L = U \mathbf{n}_L = V_L^{\ell\dagger} \nu'_L = \begin{pmatrix} \nu_{eL} \\ \nu_{\mu L} \\ \nu_{\tau L} \end{pmatrix}$$

► They allow us to write the Leptonic Weak Charged Current as in the SM:

$$j_{W,L}^\rho = 2 \overline{\nu_L} \gamma^\rho \ell_L = 2 \sum_{\alpha=e,\mu,\tau} \overline{\nu_{\alpha L}} \gamma^\rho \ell_{\alpha L}$$

- Each left-handed flavor neutrino field is associated with the corresponding charged lepton field which describes a massive charged lepton (e , μ , τ).
- In practice left-handed flavor neutrino fields are useful for calculations in the SM approximation of massless neutrinos (interactions).
- If neutrino masses must be taken into account, it is necessary to use

$$j_{W,L}^\rho = 2 \overline{\mathbf{n}_L} U^\dagger \gamma^\rho \ell_L = 2 \sum_{k=1}^3 \sum_{\alpha=e,\mu,\tau} U_{\alpha k}^* \overline{\nu_{kL}} \gamma^\rho \ell_{\alpha L}$$

Flavor Lepton Numbers

Flavor Neutrino Fields are useful for defining
Flavor Lepton Numbers
as in the SM

	L_e	L_μ	L_τ		L_e	L_μ	L_τ
(ν_e, e^-)	+1	0	0	(ν_e^c, e^+)	-1	0	0
(ν_μ, μ^-)	0	+1	0	(ν_μ^c, μ^+)	0	-1	0
(ν_τ, τ^-)	0	0	+1	(ν_τ^c, τ^+)	0	0	-1

$$L = L_e + L_\mu + L_\tau$$

Standard Model:

Lepton numbers are conserved

- Leptonic Weak Charged Current is invariant under the global $U(1)$ gauge transformations

$$\ell_{\alpha L} \rightarrow e^{i\varphi_\alpha} \ell_{\alpha L} \quad \nu_{\alpha L} \rightarrow e^{i\varphi_\alpha} \nu_{\alpha L} \quad (\alpha = e, \mu, \tau)$$

- If neutrinos are massless (SM), Noether's theorem implies that there is, for each flavor, a conserved current:

$$j_\alpha^\rho = \overline{\nu_{\alpha L}} \gamma^\rho \nu_{\alpha L} + \overline{\ell_\alpha} \gamma^\rho \ell_\alpha \quad \partial_\rho j_\alpha^\rho = 0$$

and a conserved charge:

$$L_\alpha = \int d^3x j_\alpha^0(x) \quad \partial_0 L_\alpha = 0$$

$$\begin{aligned} :L_\alpha: &= \int \frac{d^3p}{(2\pi)^3 2E} \left[a_{\nu_\alpha}^{(-)\dagger}(p) a_{\nu_\alpha}^{(-)}(p) - b_{\nu_\alpha}^{(+)\dagger}(p) b_{\nu_\alpha}^{(+)}(p) \right] \\ &+ \int \frac{d^3p}{(2\pi)^3 2E} \sum_{h=\pm 1} \left[a_{\ell_\alpha}^{(h)\dagger}(p) a_{\ell_\alpha}^{(h)}(p) - b_{\ell_\alpha}^{(h)\dagger}(p) b_{\ell_\alpha}^{(h)}(p) \right] \end{aligned}$$

► Lepton-Higgs Yukawa Lagrangian:

$$\mathcal{L}_{H,L} = - \left(\frac{v + H}{\sqrt{2}} \right) \left[\sum_{\alpha=e,\mu,\tau} y_\alpha^\ell \overline{\ell_{\alpha L}} \ell_{\alpha R} + \sum_{k=1}^3 y_k^\nu \overline{\nu_{k L}} \nu_{k R} \right] + \text{H.c.}$$

► Mixing: $\nu_{\alpha L} = \sum_{k=1}^3 U_{\alpha k} \nu_{k L} \quad \Longleftrightarrow \quad \nu_{k L} = \sum_{\alpha=e,\mu,\tau} U_{\alpha k}^* \nu_{\alpha L}$

$$\mathcal{L}_{H,L} = - \left(\frac{v + H}{\sqrt{2}} \right) \sum_{\alpha=e,\mu,\tau} \left[y_\alpha^\ell \overline{\ell_{\alpha L}} \ell_{\alpha R} + \overline{\nu_{\alpha L}} \sum_{k=1}^3 U_{\alpha k} y_k^\nu \nu_{k R} \right] + \text{H.c.}$$

► Invariant for

$$\ell_{\alpha L} \rightarrow e^{i\varphi_\alpha} \ell_{\alpha L}, \quad \nu_{\alpha L} \rightarrow e^{i\varphi_\alpha} \nu_{\alpha L}$$

$$\ell_{\alpha R} \rightarrow e^{i\varphi_\alpha} \ell_{\alpha R}, \quad \sum_{k=1}^3 U_{\alpha k} y_k^\nu \nu_{k R} \rightarrow e^{i\varphi_\alpha} \sum_{k=1}^3 U_{\alpha k} y_k^\nu \nu_{k R}$$

► But kinetic part of neutrino Lagrangian is not invariant

$$\mathcal{L}_{\text{kinetic}}^{(\nu)} = \sum_{\alpha=e,\mu,\tau} \overline{\nu_{\alpha L}} i \partial^\mu \nu_{\alpha L} + \sum_{k=1}^3 \overline{\nu_{k R}} i \partial^\mu \nu_{k R}$$

because $\sum_{k=1}^3 U_{\alpha k} y_k^\nu \nu_{k R}$ is not a unitary combination of the $\nu_{k R}$'s

$$\mathcal{L}_{\text{mass}}^D = - \begin{pmatrix} \overline{\nu_{eL}} & \overline{\nu_{\mu L}} & \overline{\nu_{\tau L}} \end{pmatrix} \begin{pmatrix} m_{ee}^D & m_{e\mu}^D & m_{e\tau}^D \\ m_{\mu e}^D & m_{\mu\mu}^D & m_{\mu\tau}^D \\ m_{\tau e}^D & m_{\tau\mu}^D & m_{\tau\tau}^D \end{pmatrix} \begin{pmatrix} \nu_{eR} \\ \nu_{\mu R} \\ \nu_{\tau R} \end{pmatrix} + \text{H.c.}$$

L_e, L_μ, L_τ are not conserved

L is conserved: $L(\nu_{\alpha R}) = L(\nu_{\beta L}) \Rightarrow |\Delta L| = 0$

Total Lepton Number

- Dirac neutrino masses violate conservation of Flavor Lepton Numbers
- Total Lepton Number is conserved, because Lagrangian is invariant under the global $U(1)$ gauge transformations

$$\begin{aligned}\nu_{kL} &\rightarrow e^{i\varphi} \nu_{kL}, & \nu_{kR} &\rightarrow e^{i\varphi} \nu_{kR} & (k = 1, 2, 3) \\ \ell_{\alpha L} &\rightarrow e^{i\varphi} \ell_{\alpha L}, & \ell_{\alpha R} &\rightarrow e^{i\varphi} \ell_{\alpha R} & (\alpha = e, \mu, \tau)\end{aligned}$$

- From Noether's theorem:

$$j^\rho = \sum_{k=1}^3 \overline{\nu_k} \gamma^\rho \nu_k + \sum_{\alpha=e,\mu,\tau} \overline{\ell_\alpha} \gamma^\rho \ell_\alpha \quad \partial_\rho j^\rho = 0$$

Conserved charge: $L_\alpha = \int d^3x j_\alpha^0(x)$ $\partial_0 L_\alpha = 0$

$$\begin{aligned}:L: &= \sum_{k=1}^3 \int \frac{d^3p}{(2\pi)^3 2E} \sum_{h=\pm 1} \left[a_{\nu_k}^{(h)\dagger}(p) a_{\nu_k}^{(h)}(p) - b_{\nu_k}^{(h)\dagger}(p) b_{\nu_k}^{(h)}(p) \right] \\ &+ \sum_{\alpha=e,\mu,\tau} \int \frac{d^3p}{(2\pi)^3 2E} \sum_{h=\pm 1} \left[a_{\ell_\alpha}^{(h)\dagger}(p) a_{\ell_\alpha}^{(h)}(p) - b_{\ell_\alpha}^{(h)\dagger}(p) b_{\ell_\alpha}^{(h)}(p) \right]\end{aligned}$$

Mixing Matrix

- Leptonic Weak Charged Current: $j_{W,L}^\rho = 2 \overline{\mathbf{n}_L} U^\dagger \gamma^\rho \ell_L$
 - $U = V_L^{\ell\dagger} V_L^\nu = \begin{pmatrix} U_{11} & U_{12} & U_{13} \\ U_{21} & U_{22} & U_{23} \\ U_{31} & U_{32} & U_{33} \end{pmatrix} \equiv \begin{pmatrix} U_{e1} & U_{e2} & U_{e3} \\ U_{\mu 1} & U_{\mu 2} & U_{\mu 3} \\ U_{\tau 1} & U_{\tau 2} & U_{\tau 3} \end{pmatrix}$
 - Unitary $N \times N$ matrix depends on N^2 independent real parameters
- $N = 3 \quad \Rightarrow \quad \frac{N(N-1)}{2} = 3 \quad \text{Mixing Angles}$
 $\qquad\qquad\qquad \frac{N(N+1)}{2} = 6 \quad \text{Phases}$
- Not all phases are physical observables
 - Only physical effect of mixing matrix occurs through its presence in the Leptonic Weak Charged Current

- Weak Charged Current: $j_{W,L}^\rho = 2 \sum_{k=1}^3 \sum_{\alpha=e,\mu,\tau} \bar{\nu}_{kL} U_{\alpha k}^* \gamma^\rho \ell_{\alpha L}$
- Apart from the Weak Charged Current, the Lagrangian is invariant under the global phase transformations

$$\nu_k \rightarrow e^{i\varphi_k} \nu_k \quad (k = 1, 2, 3), \quad \ell_\alpha \rightarrow e^{i\varphi_\alpha} \ell_\alpha \quad (\alpha = e, \mu, \tau)$$

- Performing this transformation, the Charged Current becomes

$$j_{W,L}^\rho = 2 \sum_{k=1}^3 \sum_{\alpha=e,\mu,\tau} \bar{\nu}_{kL} e^{-i\varphi_k} U_{\alpha k}^* e^{i\varphi_\alpha} \gamma^\rho \ell_{\alpha L}$$

$$j_{W,L}^\rho = 2 \underbrace{e^{-i(\varphi_1 - \varphi_e)}}_1 \sum_{k=1}^3 \sum_{\alpha=e,\mu,\tau} \bar{\nu}_{kL} \underbrace{e^{-i(\varphi_k - \varphi_1)}}_{N-1=2} U_{\alpha k}^* \underbrace{e^{i(\varphi_\alpha - \varphi_e)}}_{N-1=2} \gamma^\rho \ell_{\alpha L}$$

- There are $1 + (N - 1) + (N - 1) = 2N - 1 = 5$ arbitrary phases of the fields that can be chosen to eliminate 5 of the 6 phases of the mixing matrix
- $2N - 1$ and not $2N$ phases of the mixing matrix can be eliminated because a common rephasing of all the fields leaves the Charged Current invariant \iff conservation of Total Lepton Number.

- The mixing matrix contains

$$\frac{N(N+1)}{2} - (2N-1) = \frac{(N-1)(N-2)}{2} = 1 \quad \text{Physical Phase}$$

- It is convenient to express the 3×3 unitary mixing matrix only in terms of the four physical parameters:

3 Mixing Angles and 1 Phase

Standard Parameterization of Mixing Matrix

$$\begin{pmatrix} \nu_{eL} \\ \nu_{\mu L} \\ \nu_{\tau L} \end{pmatrix} = \begin{pmatrix} U_{e1} & U_{e2} & U_{e3} \\ U_{\mu 1} & U_{\mu 2} & U_{\mu 3} \\ U_{\tau 1} & U_{\tau 2} & U_{\tau 3} \end{pmatrix} \begin{pmatrix} \nu_{1L} \\ \nu_{2L} \\ \nu_{3L} \end{pmatrix}$$

$$U = R_{23} W_{13} R_{12}$$

$$= \begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix} \begin{pmatrix} c_{13} & 0 & s_{13} e^{-i\delta_{13}} \\ 0 & 1 & 0 \\ -s_{13} e^{i\delta_{13}} & 0 & c_{13} \end{pmatrix} \begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

$$= \begin{pmatrix} c_{12} c_{13} & s_{12} c_{13} & s_{13} e^{-i\delta_{13}} \\ -s_{12} c_{23} - c_{12} s_{23} s_{13} e^{i\delta_{13}} & c_{12} c_{23} - s_{12} s_{23} s_{13} e^{i\delta_{13}} & s_{23} c_{13} \\ s_{12} s_{23} - c_{12} c_{23} s_{13} e^{i\delta_{13}} & -c_{12} s_{23} - s_{12} c_{23} s_{13} e^{i\delta_{13}} & c_{23} c_{13} \end{pmatrix}$$

$$c_{ab} \equiv \cos \vartheta_{ab} \quad s_{ab} \equiv \sin \vartheta_{ab} \quad 0 \leq \vartheta_{ab} \leq \frac{\pi}{2} \quad 0 \leq \delta_{13} \leq 2\pi$$

3 Mixing Angles ϑ_{12} , ϑ_{23} , ϑ_{13} and 1 Phase δ_{13}

CP Violation

- ▶ $U = U^*$ \iff CP symmetry
- ▶ General conditions for CP violation (14 conditions):
 1. No two charged leptons or two neutrinos are degenerate in mass (6 conditions)
 2. No mixing angle is equal to 0 or $\pi/2$ (6 conditions)
 3. The physical phase is different from 0 or π (2 conditions)
- ▶ These 14 conditions are combined into the single condition $\det C \neq 0$

$$C = -i [M'^\nu M'^{\nu\dagger}, M'^\ell M'^{\ell\dagger}]$$

$$\det C = -2 J \left(m_{\nu_2}^2 - m_{\nu_1}^2 \right) \left(m_{\nu_3}^2 - m_{\nu_1}^2 \right) \left(m_{\nu_3}^2 - m_{\nu_2}^2 \right) \\ \left(m_\mu^2 - m_e^2 \right) \left(m_\tau^2 - m_e^2 \right) \left(m_\tau^2 - m_\mu^2 \right)$$

- ▶ Jarlskog invariant: $J = \Im \left[U_{\mu 3} U_{e 2} U_{\mu 2}^* U_{e 3}^* \right]$

[C. Jarlskog, Phys. Rev. Lett. 55 (1985) 1039, Z. Phys. C 29 (1985) 491]

[O. W. Greenberg, Phys. Rev. D 32 (1985) 1841]

[I. Dunietz, O. W. Greenberg, Dan-di Wu, Phys. Rev. Lett. 55 (1985) 2935]

Example: $\vartheta_{12} = 0$

$$U = R_{23} R_{13} W_{12}$$

$$W_{12} = \begin{pmatrix} \cos \vartheta_{12} & \sin \vartheta_{12} e^{-i\delta_{12}} & 0 \\ -\sin \vartheta_{12} e^{-i\delta_{12}} & \cos \vartheta_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

$$\vartheta_{12} = 0 \quad \implies \quad W_{12} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} = \mathbf{1}$$

real mixing matrix $U = R_{23} R_{13}$

Example: $\vartheta_{13} = \pi/2$

$$U = R_{23} W_{13} R_{12}$$

$$W_{13} = \begin{pmatrix} \cos \vartheta_{13} & 0 & \sin \vartheta_{13} e^{-i\delta_{13}} \\ 0 & 1 & 0 \\ -\sin \vartheta_{13} e^{i\delta_{13}} & 0 & \cos \vartheta_{13} \end{pmatrix}$$

$$\vartheta_{13} = \pi/2 \quad \Rightarrow \quad W_{13} = \begin{pmatrix} 0 & 0 & e^{-i\delta_{13}} \\ 0 & 1 & 0 \\ -e^{i\delta_{13}} & 0 & 0 \end{pmatrix}$$

$$U = \begin{pmatrix} 0 & 0 & e^{-i\delta_{13}} \\ -s_{12} c_{23} - c_{12} s_{23} e^{i\delta_{13}} & c_{12} c_{23} - s_{12} s_{23} e^{i\delta_{13}} & 0 \\ s_{12} s_{23} - c_{12} c_{23} e^{i\delta_{13}} & -c_{12} s_{23} - s_{12} c_{23} e^{i\delta_{13}} & 0 \end{pmatrix}$$

$$U = \begin{pmatrix} 0 & 0 & e^{-i\delta_{13}} \\ |U_{\mu 1}|e^{i\lambda_{\mu 1}} & |U_{\mu 2}|e^{i\lambda_{\mu 2}} & 0 \\ |U_{\tau 1}|e^{i\lambda_{\tau 1}} & |U_{\tau 2}|e^{i\lambda_{\tau 2}} & 0 \end{pmatrix}$$

$$\lambda_{\mu 1} - \lambda_{\mu 2} = \lambda_{\tau 1} - \lambda_{\tau 2} \pm \pi \quad \lambda_{\tau 1} - \lambda_{\mu 1} = \lambda_{\tau 2} - \lambda_{\mu 2} \pm \pi$$

$$\nu_k \rightarrow e^{i\varphi_k} \nu_k \quad (k = 1, 2, 3), \quad \ell_\alpha \rightarrow e^{i\varphi_\alpha} \ell_\alpha \quad (\alpha = e, \mu, \tau)$$

$$U \rightarrow \begin{pmatrix} e^{-i\varphi_e} & 0 & 0 \\ 0 & e^{-i\varphi_\mu} & 0 \\ 0 & 0 & e^{-i\varphi_\tau} \end{pmatrix} \begin{pmatrix} 0 & 0 & e^{-i\delta_{13}} \\ |U_{\mu 1}|e^{i\lambda_{\mu 1}} & |U_{\mu 2}|e^{i\lambda_{\mu 2}} & 0 \\ |U_{\tau 1}|e^{i\lambda_{\tau 1}} & |U_{\tau 2}|e^{i\lambda_{\tau 2}} & 0 \end{pmatrix} \begin{pmatrix} e^{i\varphi_1} & 0 & 0 \\ 0 & e^{i\varphi_2} & 0 \\ 0 & 0 & e^{i\varphi_3} \end{pmatrix}$$

$$U = \begin{pmatrix} 0 & 0 & e^{i(-\delta_{13}-\varphi_e+\varphi_3)} \\ |U_{\mu 1}|e^{i(\lambda_{\mu 1}-\varphi_\mu+\varphi_1)} & |U_{\mu 2}|e^{i(\lambda_{\mu 2}-\varphi_\mu+\varphi_2)} & 0 \\ |U_{\tau 1}|e^{i(\lambda_{\tau 1}-\varphi_\tau+\varphi_1)} & |U_{\tau 2}|e^{i(\lambda_{\tau 2}-\varphi_\tau+\varphi_2)} & 0 \end{pmatrix}$$

$$\varphi_1 = 0 \quad \varphi_\mu = \lambda_{\mu 1} \quad \varphi_\tau = \lambda_{\tau 1} \quad \varphi_2 = \varphi_\mu - \lambda_{\mu 2} = \lambda_{\mu 1} - \lambda_{\mu 2}$$

$$\varphi_2 = \varphi_\tau - \lambda_{\tau 2} \pm \pi = \lambda_{\tau 1} - \lambda_{\tau 2} \pm \pi = \lambda_{\mu 1} - \lambda_{\mu 2} \quad \text{OK!}$$

$$U = \begin{pmatrix} 0 & 0 & \pm 1 \\ |U_{\mu 1}| & |U_{\mu 2}| & 0 \\ |U_{\tau 1}| & -|U_{\tau 2}| & 0 \end{pmatrix}$$

Example: $m_{\nu_2} = m_{\nu_3}$

$$j_{W,L}^\rho = 2 \overline{\mathbf{n}_L} U^\dagger \gamma^\rho \ell_L$$

$$U = R_{12} R_{13} W_{23} \implies j_{W,L}^\rho = 2 \overline{\mathbf{n}_L} W_{23}^\dagger R_{13}^\dagger R_{12}^\dagger \gamma^\rho \ell_L$$

$$W_{23} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos \vartheta_{23} & \sin \vartheta_{23} e^{-i\delta_{23}} \\ 0 & -\sin \vartheta_{23} e^{-i\delta_{23}} & \cos \vartheta_{23} \end{pmatrix}$$

$$W_{23} \mathbf{n}_L = \mathbf{n}'_L \quad R_{12} R_{13} = U' \implies j_{W,L}^\rho = 2 \overline{\mathbf{n}'_L} U'^\dagger \gamma^\rho \ell_L$$

ν_2 and ν_3 are indistinguishable

drop the prime $\implies j_{W,L}^\rho = 2 \overline{\mathbf{n}_L} U^\dagger \gamma^\rho \ell_L$

real mixing matrix $U = R_{12} R_{13}$

Jarlskog Invariant

$$J = \Im \left[U_{\mu 3} U_{e 2} U_{\mu 2}^* U_{e 3}^* \right]$$

- ▶ All the imaginary parts of the rephasing-invariant quartic products $U_{\alpha k}^* U_{\beta k} U_{\alpha j} U_{\beta j}^*$ are equal up to a sign:

$$\Im \left[U_{\alpha k}^* U_{\beta k} U_{\alpha j} U_{\beta j}^* \right] = \pm J$$

- ▶ In the standard parameterization

$$\begin{aligned} J &= c_{12} s_{12} c_{23} s_{23} c_{13}^2 s_{13} \sin \delta_{13} \\ &= \frac{1}{8} \sin 2\vartheta_{12} \sin 2\vartheta_{23} \cos \vartheta_{13} \sin 2\vartheta_{13} \sin \delta_{13} \end{aligned}$$

- ▶ The Jarlskog invariant is useful for quantifying CP violation in a parameterization-independent way

Maximal CP Violation

- Maximal CP violation is defined as the case in which $|J|$ has its maximum possible value

$$|J|_{\max} = \frac{1}{6\sqrt{3}}$$

- In the standard parameterization it is obtained for

$$\vartheta_{12} = \vartheta_{23} = \pi/4, \quad s_{13} = 1/\sqrt{3}, \quad \sin \delta_{13} = \pm 1$$

- This case is called **Trimaximal Mixing**. All the absolute values of the elements of the mixing matrix are equal to $1/\sqrt{3}$:

$$U = \begin{pmatrix} \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{3}} & \mp \frac{i}{\sqrt{3}} \\ -\frac{1}{2} \mp \frac{i}{2\sqrt{3}} & \frac{1}{2} \mp \frac{i}{2\sqrt{3}} & \frac{1}{\sqrt{3}} \\ \frac{1}{2} \mp \frac{i}{2\sqrt{3}} & -\frac{1}{2} \mp \frac{i}{2\sqrt{3}} & \frac{1}{\sqrt{3}} \end{pmatrix} = \frac{1}{\sqrt{3}} \begin{pmatrix} 1 & 1 & \mp i \\ -e^{\pm i\pi/6} & e^{\mp i\pi/6} & 1 \\ e^{\mp i\pi/6} & -e^{\pm i\pi/6} & 1 \end{pmatrix}$$

GIM Mechanism

[S.L. Glashow, J. Iliopoulos, L. Maiani, Phys. Rev. D 2 (1970) 1285]

- The unitarity of V_L^ℓ , V_R^ℓ and V_L^ν implies that the expression of the neutral weak current in terms of the lepton fields with definite masses is the same as that in terms of the primed lepton fields:

$$\begin{aligned} j_{Z,L}^\rho &= 2g_L^\nu \overline{\nu'_L} \gamma^\rho \nu'_L + 2g_L^I \overline{\ell'_L} \gamma^\rho \ell'_L + 2g_R^I \overline{\ell'_R} \gamma^\rho \ell'_R \\ &= 2g_L^\nu \overline{n_L} V_L^{\nu\dagger} \gamma^\rho V_L^\nu n_L + 2g_L^I \overline{\ell_L} V_L^{\ell\dagger} \gamma^\rho V_L^\ell \ell_L + 2g_R^I \overline{\ell_R} V_R^{\ell\dagger} \gamma^\rho V_R^\ell \ell_R \\ &= 2g_L^\nu \overline{n_L} \gamma^\rho n_L + 2g_L^I \overline{\ell_L} \gamma^\rho \ell_L + 2g_R^I \overline{\ell_R} \gamma^\rho \ell_R \end{aligned}$$

- The unitarity of U implies the same expression for the neutral weak current in terms of the flavor neutrino fields $\nu_L = U n_L$:

$$\begin{aligned} j_{Z,L}^\rho &= 2g_L^\nu \overline{\nu_L} U \gamma^\rho U^\dagger \nu_L + 2g_L^I \overline{\ell_L} \gamma^\rho \ell_L + 2g_R^I \overline{\ell_R} \gamma^\rho \ell_R \\ &= 2g_L^\nu \overline{\nu_L} \gamma^\rho \nu_L + 2g_L^I \overline{\ell_L} \gamma^\rho \ell_L + 2g_R^I \overline{\ell_R} \gamma^\rho \ell_R \end{aligned}$$

Lepton Numbers Violating Processes

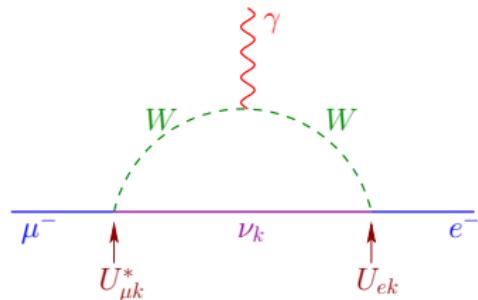

Dirac mass term allows L_e , L_μ , L_τ violating processes

Example: $\mu^\pm \rightarrow e^\pm + \gamma$, $\mu^\pm \rightarrow e^\pm + e^+ + e^-$

$$\boxed{\mu^- \rightarrow e^- + \gamma}$$

$\sum_k U_{\mu k}^* U_{ek} = 0 \Rightarrow$ only part of ν_k propagator $\propto m_k$ contributes

$$\Gamma = \underbrace{\frac{G_F m_\mu^5}{192\pi^3} \frac{3\alpha}{32\pi}}_{\text{BR}} \left| \sum_k U_{\mu k}^* U_{ek} \frac{m_k^2}{m_W^2} \right|^2$$

Suppression factor: $\frac{m_k}{m_W} \lesssim 10^{-11}$ for $m_k \lesssim 1 \text{ eV}$

$$(\text{BR})_{\text{the}} \lesssim 10^{-47}$$

$$(\text{BR})_{\text{exp}} \lesssim 10^{-11}$$

Majorana Neutrino Masses

- Dirac-Majorana Mass Term

Two-Component Theory of a Massless Neutrino

[L. Landau, Nucl. Phys. 3 (1957) 127], [T.D. Lee, C.N. Yang, Phys. Rev. 105 (1957) 1671], [A. Salam, Nuovo Cim. 5 (1957) 299]

- ▶ Dirac Equation: $(i\gamma^\mu \partial_\mu - m)\psi = 0$
- ▶ Chiral components of a Fermion Field: $\psi = \psi_L + \psi_R$
- ▶ The equations for the Chiral components are coupled by the mass:

$$i\gamma^\mu \partial_\mu \psi_L = m \psi_R$$

$$i\gamma^\mu \partial_\mu \psi_R = m \psi_L$$

- ▶ They are decoupled for a massless fermion: **Weyl Equations (1929)**

$$i\gamma^\mu \partial_\mu \psi_L = 0$$

$$i\gamma^\mu \partial_\mu \psi_R = 0$$

- ▶ A massless fermion can be described by a single chiral field ψ_L or ψ_R (Weyl Spinor).

- ψ_L and ψ_R have only two independent components: in the chiral representation

$$\psi_L = \begin{pmatrix} 0 \\ \chi_L \\ \chi_{L1} \\ \chi_{L2} \end{pmatrix} \equiv \begin{pmatrix} 0 \\ 0 \\ \chi_{L1} \\ \chi_{L2} \end{pmatrix}$$

$$\psi_R = \begin{pmatrix} \chi_R \\ 0 \end{pmatrix} \equiv \begin{pmatrix} \chi_{R1} \\ \chi_{R2} \\ 0 \\ 0 \end{pmatrix}$$

- The possibility to describe a physical particle with a Weyl spinor was rejected by Pauli in 1933 because it leads to the violation of parity
- The discovery of parity violation in 1956-57 invalidated Pauli's reasoning, opening the possibility to describe massless particles with Weyl spinor fields \Rightarrow Two-component Theory of a Massless Neutrino (1957)
- $V - A$ Charged-Current Weak Interactions $\Rightarrow \nu_L$
- In the 1960s, the Two-component Theory of a Massless Neutrino was incorporated in the SM through the assumption of the absence of ν_R

Majorana Equation

- ▶ Can a two-component spinor describe a massive fermion? Yes! (E. Majorana, 1937)
- ▶ Trick: ψ_R and ψ_L are not independent.
- ▶ The relation connecting ψ_R and ψ_L must be compatible with the Dirac equation:

$$i\gamma^\mu \partial_\mu \psi_L = m \psi_R \quad i\gamma^\mu \partial_\mu \psi_R = m \psi_L$$

- ▶ The two equations must be two ways of writing the same equation for one independent field, say ψ_L .
- ▶ Consider $i\gamma^\mu \partial_\mu \psi_R = m \psi_L$
- ▶ Take the Hermitian conjugate and multiply on the right with γ^0 :
$$-i\partial_\mu \psi_R^\dagger \gamma^{\mu\dagger} \gamma^0 = m \overline{\psi}_L$$
- ▶ $\gamma^0 \gamma^{\mu\dagger} \gamma^0 = \gamma^\mu \Rightarrow -i\partial_\mu \overline{\psi}_R \gamma^\mu = m \overline{\psi}_L$
- ▶ Transpose and multiply on the left with \mathcal{C} ($\mathcal{C} \gamma_\mu^T \mathcal{C}^{-1} = -\gamma_\mu$) \Rightarrow
$$i\gamma^\mu \partial_\mu \mathcal{C} \overline{\psi}_R^T = m \mathcal{C} \overline{\psi}_L^T$$

- $\mathcal{C} \overline{\psi_L}^T$ is right-handed and $\mathcal{C} \overline{\psi_R}^T$ is left-handed
- $i\gamma^\mu \partial_\mu \mathcal{C} \overline{\psi_R}^T = m \mathcal{C} \overline{\psi_L}^T$ has the same structure as $i\gamma^\mu \partial_\mu \psi_L = m \psi_R$
- We can consider them as identical by setting

$$\psi_R = \xi \mathcal{C} \overline{\psi_L}^T \quad \text{with} \quad |\xi|^2 = 1$$

- ξ is unphysical phase factor which can be eliminated by rephasing

$$\psi_L \rightarrow \xi^{1/2} \psi_L \quad \Rightarrow \quad \boxed{\psi_R = \mathcal{C} \overline{\psi_L}^T}$$

- Majorana Equation: $i\gamma^\mu \partial_\mu \psi_L = m \mathcal{C} \overline{\psi_L}^T$
- The field $\psi = \psi_L + \psi_R = \psi_L + \mathcal{C} \overline{\psi_L}^T$ is called Majorana Field
- Majorana Condition: $\boxed{\psi = \mathcal{C} \overline{\psi}^T}$
- A Majorana Field has only two independent components
- Chiral representation: $\psi = \begin{pmatrix} i\sigma^2 \chi_L^* \\ \chi_L \end{pmatrix}$

- ▶ Charge Conjugation: $\psi_L^C = \mathcal{C} \overline{\psi_L}^T$
- ▶ Majorana Field: $\psi = \psi_L + \psi_L^C$ Majorana Condition: $\psi = \psi^C$
- ▶ The Majorana condition implies the equality of particle and antiparticle
- ▶ Only neutral fermions can be Majorana particles
- ▶ Dirac equation for fermion with charge q coupled to electromagnetic field A_μ :

$$(i\gamma^\mu \partial_\mu - q\gamma^\mu A_\mu - m)\psi = 0 \quad (\text{particle})$$

$$(i\gamma^\mu \partial_\mu + q\gamma^\mu A_\mu - m)\psi^C = 0 \quad (\text{antiparticle})$$

If $q \neq 0$, ψ and ψ^C obey different equations and the Majorana equality cannot be imposed

- ▶ For a Majorana field, the electromagnetic current vanishes identically:

$$\overline{\psi}\gamma^\mu\psi = \overline{\psi^C}\gamma^\mu\psi^C = -\psi^T C^\dagger \gamma^\mu C \overline{\psi}^T = \overline{\psi} C \gamma^\mu T C^\dagger \psi = -\overline{\psi}\gamma^\mu\psi = 0$$

Majorana Lagrangian

- ▶ Let us consider first the Dirac Lagrangian

$$\mathcal{L}^D = \bar{\nu}(i\partial - m)\nu = \bar{\nu}_L i\partial \nu_L + \bar{\nu}_R i\partial \nu_R - m(\bar{\nu}_R \nu_L + \bar{\nu}_L \nu_R)$$

- ▶ In order to write a Majorana Mass Term using ν_L alone, we make the substitution $\nu_R \rightarrow \nu_L^C = C \bar{\nu}_L^T$

- ▶ Majorana Lagrangian:

$$\mathcal{L}^M = \frac{1}{2} [\bar{\nu}_L i\partial \nu_L + \bar{\nu}_L^C i\partial \nu_L^C - m(\bar{\nu}_L^C \nu_L + \bar{\nu}_L \nu_L^C)]$$

- ▶ The overall factor $1/2$ avoids double counting in the derivation of the due to the fact that ν_L^C and $\bar{\nu}_L$ are not independent ($\nu_L^C = C \bar{\nu}_L^T$)

$$\mathcal{L}^M = \bar{\nu}_L i\partial \nu_L - \frac{m}{2} (-\nu_L^T C^\dagger \nu_L + \bar{\nu}_L C \bar{\nu}_L^T)$$

- Majorana Field: $\nu = \nu_L + \nu_L^C$
- Majorana Condition: $\nu^C = \nu$
- Majorana Lagrangian: $\mathcal{L}^M = \frac{1}{2} \bar{\nu} (i\partial - m) \nu$
- The factor $1/2$ distinguishes the Majorana Lagrangian from the Dirac Lagrangian
- Quantized Dirac Neutrino Field:

$$\nu(x) = \int \frac{d^3 p}{(2\pi)^3 2E} \sum_{h=\pm 1} \left[a^{(h)}(p) u^{(h)}(p) e^{-ip \cdot x} + b^{(h)\dagger}(p) v^{(h)}(p) e^{ip \cdot x} \right]$$
- Quantized Majorana Neutrino Field [$b^{(h)}(p) = a^{(h)}(p)$]

$$\nu(x) = \int \frac{d^3 p}{(2\pi)^3 2E} \sum_{h=\pm 1} \left[a^{(h)}(p) u^{(h)}(p) e^{-ip \cdot x} + a^{(h)\dagger}(p) v^{(h)}(p) e^{ip \cdot x} \right]$$
- A Majorana field has half the degrees of freedom of a Dirac field

Majorana Antineutrino Jargon

- ▶ A Majorana neutrino is the same as a Majorana antineutrino
- ▶ Neutrino interactions are described by the CC and NC Lagrangians

$$\mathcal{L}_{I,L}^{CC} = -\frac{g}{\sqrt{2}} (\overline{\nu}_L \gamma^\mu \ell_L W_\mu + \overline{\ell}_L \gamma^\mu \nu_L W_\mu^\dagger)$$

$$\mathcal{L}_{I,\nu}^{NC} = -\frac{g}{2 \cos \vartheta_W} \overline{\nu}_L \gamma^\mu \nu_L Z_\mu$$

- ▶ In practice, since detectable neutrinos are always ultrarelativistic, the neutrino mass can be neglected in interactions

- In interaction amplitudes we neglect corrections of order m/E

► Dirac:

$$\left\{ \begin{array}{l} \nu_L \\ \bar{\nu}_L \end{array} \right\} \left\{ \begin{array}{l} \text{destroys left-handed neutrinos} \\ \text{creates right-handed antineutrinos} \\ \text{destroys right-handed antineutrinos} \\ \text{creates left-handed neutrinos} \end{array} \right.$$

► Majorana:

$$\left\{ \begin{array}{l} \nu_L \\ \bar{\nu}_L \end{array} \right\} \left\{ \begin{array}{l} \text{destroys left-handed neutrinos} \\ \text{creates right-handed neutrinos} \\ \text{destroys right-handed neutrinos} \\ \text{creates left-handed neutrinos} \end{array} \right.$$

- Common definitions:

Majorana neutrino with negative helicity \equiv neutrino

Majorana neutrino with positive helicity \equiv antineutrino

Lepton Number

► The Majorana Mass Term

$$\mathcal{L}_{\text{mass}}^M = \frac{1}{2} m \left(\nu_L^T C^\dagger \nu_L + \nu_L^\dagger C \nu_L^* \right)$$

is not invariant under the global $U(1)$ gauge transformation

$$\nu_L \rightarrow e^{i\varphi} \nu_L$$
$$\cancel{L = -1} \quad \leftarrow \quad \boxed{\nu^c = \nu} \quad \rightarrow \quad \cancel{L = +1}$$

► The Total Lepton Number is not conserved: $\Delta L = \pm 2$

► However, the Total Lepton Number is conserved in interactions in the ultrarelativistic approximation of massless neutrinos

► Best process to find the violation of the Total Lepton Number:
Neutrinoless Double- β Decay

CP Symmetry

- Under a CP transformation

$$U_{CP}\nu_L(x)U_{CP}^{-1} = \xi_\nu^{CP} \gamma^0 \nu_L^C(x_P)$$

$$U_{CP}\nu_L^C(x)U_{CP}^{-1} = -\xi_\nu^{CP*} \gamma^0 \nu_L(x_P)$$

$$U_{CP}\bar{\nu}_L(x)U_{CP}^{-1} = \xi_\nu^{CP*} \bar{\nu}_L^C(x_P) \gamma^0$$

$$U_{CP}\bar{\nu}_L^C(x)U_{CP}^{-1} = -\xi_\nu^{CP} \bar{\nu}_L(x_P) \gamma^0$$

with $|\xi_\nu^{CP}|^2 = 1$, $x^\mu = (x^0, \vec{x})$, and $x_P^\mu = (x^0, -\vec{x})$

- The theory is CP-symmetric if there are values of the phase ξ_ν^{CP} such that the Lagrangian transforms as

$$U_{CP}\mathcal{L}(x)U_{CP}^{-1} = \mathcal{L}(x_P)$$

in order to keep invariant the action $I = \int d^4x \mathcal{L}(x)$

► The Majorana Mass Term

$$\mathcal{L}_{\text{mass}}^M(x) = -\frac{1}{2} m \left[\overline{\nu_L^C}(x) \nu_L(x) + \overline{\nu_L}(x) \nu_L^C(x) \right]$$

transforms as

$$U_{\text{CP}} \mathcal{L}_{\text{mass}}^M(x) U_{\text{CP}}^{-1} = -\frac{1}{2} m \left[-(\xi_\nu^{\text{CP}})^2 \overline{\nu_L}(x_{\text{P}}) \nu_L^C(x_{\text{P}}) \right. \\ \left. - (\xi_\nu^{\text{CP}*})^2 \overline{\nu_L^C}(x_{\text{P}}) \nu_L(x_{\text{P}}) \right]$$

► $U_{\text{CP}} \mathcal{L}_{\text{mass}}^M(x) U_{\text{CP}}^{-1} = \mathcal{L}_{\text{mass}}^M(x_{\text{P}})$ for $\boxed{\xi_\nu^{\text{CP}} = \pm i}$

► The one-generation Majorana theory is CP-symmetric

► The Majorana case is different from the Dirac case, in which the CP phase ξ_ν^{CP} is arbitrary

No Majorana Neutrino Mass in the SM

- ▶ A Majorana Mass Term $\propto [\nu_L^T C^\dagger \nu_L - \bar{\nu}_L C \bar{\nu}_L^T]$ involves only the neutrino left-handed chiral field ν_L , which is present in the SM (one for each lepton generation)
- ▶ Eigenvalues of the weak isospin I , of its third component I_3 , of the hypercharge Y and of the charge Q of the lepton and Higgs multiplets:

		I	I_3	Y	$Q = I_3 + \frac{Y}{2}$
lepton doublet	$L_L = \begin{pmatrix} \nu_L \\ \ell_L \end{pmatrix}$	1/2	1/2 -1/2	-1 +1	0 -1
lepton singlet	ℓ_R	0	0	-2	-1
Higgs doublet	$\Phi(x) = \begin{pmatrix} \phi^+(x) \\ \phi^0(x) \end{pmatrix}$	1/2	1/2 -1/2	+1 0	1 0

- ▶ $\nu_L^T C^\dagger \nu_L$ has $I_3 = 1$ and $Y = -2 \Rightarrow$ needed Higgs triplet with $Y = 2$

Effective Majorana Mass

- Dimensional analysis: Fermion Field $\sim [E]^{3/2}$ Boson Field $\sim [E]$
- Dimensionless action: $I = \int d^4x \mathcal{L}(x) \implies \mathcal{L}(x) \sim [E]^4$
- Kinetic terms: $\bar{\psi} i\partial^\mu \psi \sim [E]^4$, $(\partial_\mu \phi)^\dagger \partial^\mu \phi \sim [E]^4$
- Mass terms: $m\bar{\psi}\psi \sim [E]^4$, $m^2 \phi^\dagger \phi \sim [E]^4$
- CC weak interaction: $g\bar{\nu}_L \gamma^\rho \ell_L W_\rho \sim [E]^4$
- Yukawa couplings: $y\bar{L}_L \Phi \ell_R \sim [E]^4$
- Product of fields \mathcal{O}_d with energy dimension $d \equiv \text{dim-}d$ operator
- $\mathcal{L}_{(\mathcal{O}_d)} = C_{(\mathcal{O}_d)} \mathcal{O}_d \implies C_{(\mathcal{O}_d)} \sim [E]^{4-d}$
- $\mathcal{O}_{d>4}$ are not renormalizable

- ▶ SM Lagrangian includes all $\mathcal{O}_{d \leq 4}$ invariant under $SU(2)_L \times U(1)_Y$
- ▶ SM cannot be considered as the final theory of everything
- ▶ SM is an effective low-energy theory
- ▶ It is likely that SM is the low-energy product of the symmetry breaking of a high-energy unified theory
- ▶ It is plausible that at low-energy there are effective non-renormalizable $\mathcal{O}_{d > 4}$ [S. Weinberg, Phys. Rev. Lett. 43 (1979) 1566]
- ▶ All \mathcal{O}_d must respect $SU(2)_L \times U(1)_Y$, because they are generated by the high-energy theory which must include the gauge symmetries of the SM in order to be effectively reduced to the SM at low energies
- ▶ Approach analogous to effective non-renormalizable four-fermion Fermi theory of weak interactions, which is a low-energy manifestation of the SM

- $\mathcal{O}_{d>4}$ is suppressed by a coefficient $\mathcal{M}^{-(d-4)}$, where \mathcal{M} is a heavy mass characteristic of the symmetry breaking scale of the high-energy unified theory:

$$\mathcal{L} = \mathcal{L}_{\text{SM}} + \frac{g_5}{\mathcal{M}} \mathcal{O}_5 + \frac{g_6}{\mathcal{M}^2} \mathcal{O}_6 + \dots$$

- Analogy with $\mathcal{L}_{\text{eff}}^{(\text{CC})} = -\frac{G_F}{\sqrt{2}} j_W^\dagger j_W^\mu j_W^\mu$:

$$\mathcal{O}_6 \rightarrow j_W^\dagger j_W^\mu j_W^\mu \quad \frac{g_6}{\mathcal{M}^2} \rightarrow \frac{G_F}{\sqrt{2}} = \frac{g^2}{8m_W^2}$$

- $\mathcal{M}^{-(d-4)}$ is a strong suppression factor which limits the observability of the low-energy effects of the new physics beyond the SM
- The difficulty to observe the effects of the effective low-energy non-renormalizable operators increase rapidly with their dimensionality
- $\mathcal{O}_5 \implies$ Majorana neutrino masses (Lepton number violation)
- $\mathcal{O}_6 \implies$ Baryon number violation (proton decay)

- Only one dim-5 operator:

$$\begin{aligned}\mathcal{O}_5 &= (L_L^T \tau_2 \Phi) \mathcal{C}^\dagger (\Phi^T \tau_2 L_L) + \text{H.c.} \\ &= \frac{1}{2} (L_L^T \mathcal{C}^\dagger \tau_2 \vec{\tau} L_L) \cdot (\Phi^T \tau_2 \vec{\tau} \Phi) + \text{H.c.}\end{aligned}$$

$$\mathcal{L}_5 = \frac{g_5}{2\mathcal{M}} (L_L^T \mathcal{C}^\dagger \tau_2 \vec{\tau} L_L) \cdot (\Phi^T \tau_2 \vec{\tau} \Phi) + \text{H.c.}$$

- Electroweak Symmetry Breaking: $\Phi = \begin{pmatrix} \phi^+ \\ \phi^0 \end{pmatrix} \xrightarrow[\text{Breaking}]{\text{Symmetry}} \begin{pmatrix} 0 \\ v/\sqrt{2} \end{pmatrix}$

$$\mathcal{L}_5 \xrightarrow[\text{Breaking}]{\text{Symmetry}} \mathcal{L}_{\text{mass}}^M = \frac{1}{2} \frac{g_5 v^2}{\mathcal{M}} \nu_L^T \mathcal{C}^\dagger \nu_L + \text{H.c.} \implies$$

$$m = \frac{g_5 v^2}{\mathcal{M}}$$

- ▶ The study of Majorana neutrino masses provides the most accessible low-energy window on new physics beyond the SM
- ▶ $m \propto \frac{v^2}{\mathcal{M}} \propto \frac{m_D^2}{\mathcal{M}}$ natural explanation of smallness of neutrino masses
(special case: See-Saw Mechanism)
- ▶ Example: $m_D \sim v \sim 10^2 \text{ GeV}$ and $\mathcal{M} \sim 10^{15} \text{ GeV} \implies m \sim 10^{-2} \text{ eV}$

Mixing of Three Majorana Neutrinos

$$\nu'_L \equiv \begin{pmatrix} \nu'_{eL} \\ \nu'_{\mu L} \\ \nu'_{\tau L} \end{pmatrix} \quad \mathcal{L}_{\text{mass}}^M = \frac{1}{2} \left(\nu'^T_L C^\dagger M^L \nu'_L - \overline{\nu'_L} M^{L\dagger} C \nu'^T_L \right)$$
$$= \frac{1}{2} \sum_{\alpha, \beta = e, \mu, \tau} \left(\nu'^T_{\alpha L} C^\dagger M^L_{\alpha\beta} \nu'_{\beta L} - \overline{\nu'_{\alpha L}} M^{L*}_{\beta\alpha} C \nu'^T_{\beta L} \right)$$

► In general, the matrix M^L is a complex symmetric matrix

$$\sum_{\alpha, \beta} \nu'^T_{\alpha L} C^\dagger M^L_{\alpha\beta} \nu'_{\beta L} = - \sum_{\alpha, \beta} \nu'^T_{\beta L} M^L_{\alpha\beta} (C^\dagger)^T \nu'_{\alpha L}$$
$$= \sum_{\alpha, \beta} \nu'^T_{\beta L} C^\dagger M^L_{\alpha\beta} \nu'_{\alpha L} = \sum_{\alpha, \beta} \nu'^T_{\alpha L} C^\dagger M^L_{\beta\alpha} \nu'_{\beta L}$$

$$M^L_{\alpha\beta} = M^L_{\beta\alpha} \quad \iff \quad M^L = M^{L^T}$$

- $\mathcal{L}_{\text{mass}}^M = \frac{1}{2} (\nu_L'^T C^\dagger M^L \nu_L' - \overline{\nu_L'} M^{L\dagger} C \nu_L'^T)$
- Diagonalization: $\nu_L' = \mathbf{n}_L V_L^{\nu\dagger}$ with unitary V_L^ν
- $(V_L^\nu)^T M^L V_L^\nu = M$, $M_{kj} = m_k \delta_{kj}$ ($k, j = 1, 2, 3$)
- Real and Positive m_k

- Left-handed chiral fields with definite mass: $\mathbf{n}_L = V_L^{\nu\dagger} \nu_L' = \begin{pmatrix} \nu_{1L} \\ \nu_{2L} \\ \nu_{3L} \end{pmatrix}$

$$\begin{aligned} \mathcal{L}_{\text{mass}}^M &= \frac{1}{2} (\mathbf{n}_L^T C^\dagger M \mathbf{n}_L - \overline{\mathbf{n}_L} M C \mathbf{n}_L^T) \\ &= \frac{1}{2} \sum_{k=1}^3 m_k (\nu_{kL}^T C^\dagger \nu_{kL} - \overline{\nu_{kL}} C \nu_{kL}^T) \end{aligned}$$

- Majorana fields of massive neutrinos: $\nu_k = \nu_{kL} + \nu_{kL}^C$

$$\boxed{\nu_k^C = \nu_k}$$

- $\mathbf{n} = \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix} \implies \mathcal{L}^M = \frac{1}{2} \sum_{k=1}^3 \overline{\nu_k} (i\partial - m_k) \nu_k = \frac{1}{2} \overline{\mathbf{n}} (i\partial - M) \mathbf{n}$

Mixing Matrix

- Leptonic Weak Charged Current:

$$j_{W,L}^\rho = 2 \overline{\mathbf{n}_L} U^\dagger \gamma^\rho \ell_L \quad \text{with} \quad U = V_L^{\ell\dagger} V_L^\nu$$

- Definition of the left-handed flavor neutrino fields:

$$\nu_L = U \mathbf{n}_L = V_L^{\ell\dagger} \nu'_L = \begin{pmatrix} \nu_{eL} \\ \nu_{\mu L} \\ \nu_{\tau L} \end{pmatrix}$$

- Leptonic Weak Charged Current has the SM form

$$j_{W,L}^\rho = 2 \overline{\nu_L} \gamma^\rho \ell_L = 2 \sum_{\alpha=e,\mu,\tau} \overline{\nu_{\alpha L}} \gamma^\rho \ell_{\alpha L}$$

- Important difference with respect to Dirac case:
Two additional CP-violating phases: Majorana phases

- The Majorana Mass Term $\mathcal{L}_{\text{mass}}^M = \frac{1}{2} \sum_{k=1}^3 m_k (\nu_{kL}^T C^\dagger \nu_{kL} - \overline{\nu_{kL}} C \nu_{kL}^T)$ is not invariant under the global $U(1)$ gauge transformations $\nu_{kL} \rightarrow e^{i\varphi_k} \nu_{kL}$ ($k = 1, 2, 3$)
- The left-handed massive neutrino fields cannot be rephased in order to eliminate the two phases that can be factorized on the right of the mixing matrix

$$U = U^D D^M \quad D^M = \begin{pmatrix} 1 & 0 & 0 \\ 0 & e^{i\lambda_2} & 0 \\ 0 & 0 & e^{i\lambda_3} \end{pmatrix}$$

- U^D is analogous to a Dirac mixing matrix, with one Dirac phase
 - Standard parameterization:
- $$U^D = \begin{pmatrix} c_{12}c_{13} & s_{12}c_{13} & s_{13}e^{-i\delta_{13}} \\ -s_{12}c_{23} - c_{12}s_{23}s_{13}e^{i\delta_{13}} & c_{12}c_{23} - s_{12}s_{23}s_{13}e^{i\delta_{13}} & s_{23}c_{13} \\ s_{12}s_{23} - c_{12}c_{23}s_{13}e^{i\delta_{13}} & -c_{12}s_{23} - s_{12}c_{23}s_{13}e^{i\delta_{13}} & c_{23}c_{13} \end{pmatrix}$$
- Jarlskog invariant: $J = c_{12}s_{12}c_{23}s_{23}c_{13}^2s_{13}\sin\delta_{13}$ as in the Dirac case

- $D^M = \text{diag}(e^{i\lambda_1}, e^{i\lambda_2}, e^{i\lambda_3})$, but only two Majorana phases are physical
- All measurable quantities depend only on the differences of the Majorana phases

$$\ell_\alpha \rightarrow e^{i\varphi} \ell_\alpha \implies e^{i\lambda_k} \rightarrow e^{i(\lambda_k - \varphi)}$$

$e^{i(\lambda_k - \lambda_j)}$ remains constant

- Our convention: $\lambda_1 = 0 \implies D^M = \text{diag}(1, e^{i\lambda_2}, e^{i\lambda_3})$
- CP is conserved if all the elements of each column of the mixing matrix are either real or purely imaginary:

$$\delta_{13} = 0 \text{ or } \pi \quad \text{and} \quad \lambda_k = 0 \text{ or } \pi/2 \text{ or } \pi \text{ or } 3\pi/2$$

Dirac-Majorana Mass Term

- Dirac Neutrino Masses
- Majorana Neutrino Masses
- Dirac-Majorana Mass Term
 - One Generation

 - Pseudo-Dirac Neutrinos
 - See-Saw Mechanism
 - Majorana Neutrino Mass?
 - Right-Handed Neutrino Mass Term
 - Singlet Majoron Model
 - Three-Generation Mixing
 - Number of Massive Neutrinos?

One Generation

If ν_R exists, the most general mass term is the

Dirac-Majorana Mass Term

$$\mathcal{L}_{\text{mass}}^{\text{D+M}} = \mathcal{L}_{\text{mass}}^{\text{D}} + \mathcal{L}_{\text{mass}}^{\text{L}} + \mathcal{L}_{\text{mass}}^{\text{R}}$$

$$\mathcal{L}_{\text{mass}}^{\text{D}} = -m_{\text{D}} \overline{\nu_R} \nu_L + \text{H.c.} \quad \text{Dirac Mass Term}$$

$$\mathcal{L}_{\text{mass}}^{\text{L}} = \frac{1}{2} m_L \nu_L^T C^\dagger \nu_L + \text{H.c.} \quad \text{Majorana Mass Term}$$

$$\mathcal{L}_{\text{mass}}^{\text{R}} = \frac{1}{2} m_R \nu_R^T C^\dagger \nu_R + \text{H.c.} \quad \text{New Majorana Mass Term!}$$

- Column matrix of left-handed chiral fields: $N_L = \begin{pmatrix} \nu_L \\ \nu_R^C \end{pmatrix} = \begin{pmatrix} \nu_L \\ C \bar{\nu}_R \end{pmatrix}^T$
- $\mathcal{L}_{\text{mass}}^{\text{D+M}} = \frac{1}{2} N_L^T C^\dagger M N_L + \text{H.c.}$ $M = \begin{pmatrix} m_L & m_D \\ m_D & m_R \end{pmatrix}$
- The Dirac-Majorana Mass Term has the structure of a Majorana Mass Term for two chiral neutrino fields coupled by the Dirac mass
- Diagonalization: $n_L = U^\dagger N_L = \begin{pmatrix} \nu_{1L} \\ \nu_{2L} \end{pmatrix}$
 $U^T M U = \begin{pmatrix} m_1 & 0 \\ 0 & m_2 \end{pmatrix}$ Real $m_k \geq 0$
- $\mathcal{L}_{\text{mass}}^{\text{D+M}} = \frac{1}{2} \sum_{k=1,2} m_k \nu_{kL}^T C^\dagger \nu_{kL} + \text{H.c.} = -\frac{1}{2} \sum_{k=1,2} m_k \bar{\nu}_k \nu_k$
 $\nu_k = \nu_{kL} + \nu_{kL}^C$
- Massive neutrinos are Majorana! $\nu_k = \nu_k^C$

Real Mass Matrix

- CP is conserved if the mass matrix is real: $M = M^*$
- $M = \begin{pmatrix} m_L & m_D \\ m_D & m_R \end{pmatrix}$ we consider real and positive m_R and m_D and real m_L
- A real symmetric mass matrix can be diagonalized with $U = \mathcal{O} \rho$

$$\mathcal{O} = \begin{pmatrix} \cos \vartheta & \sin \vartheta \\ -\sin \vartheta & \cos \vartheta \end{pmatrix} \quad \rho = \begin{pmatrix} \rho_1 & 0 \\ 0 & \rho_2 \end{pmatrix} \quad \rho_k^2 = \pm 1$$

$$\mathcal{O}^T M \mathcal{O} = \begin{pmatrix} m'_1 & 0 \\ 0 & m'_2 \end{pmatrix} \quad \tan 2\vartheta = \frac{2m_D}{m_R - m_L}$$
$$m'_{2,1} = \frac{1}{2} \left[m_L + m_R \pm \sqrt{(m_L - m_R)^2 + 4 m_D^2} \right]$$

- m'_1 is negative if $m_L m_R < m_D^2$

$$U^T M U = \rho^T \mathcal{O}^T M \mathcal{O} \rho = \begin{pmatrix} \rho_1^2 m'_1 & 0 \\ 0 & \rho_2^2 m'_2 \end{pmatrix} \implies m_k = \rho_k^2 m'_k$$

- m_2' is always positive:

$$m_2 = m_2' = \frac{1}{2} \left[m_L + m_R + \sqrt{(m_L - m_R)^2 + 4 m_D^2} \right]$$

- If $m_L m_R \geq m_D^2$, then $m_1' \geq 0$ and $\rho_1^2 = 1$

$$m_1 = \frac{1}{2} \left[m_L + m_R - \sqrt{(m_L - m_R)^2 + 4 m_D^2} \right]$$

$$\rho_1 = 1 \text{ and } \rho_2 = 1 \quad \Rightarrow \quad U = \begin{pmatrix} \cos \vartheta & \sin \vartheta \\ -\sin \vartheta & \cos \vartheta \end{pmatrix}$$

- If $m_L m_R < m_D^2$, then $m_1' < 0$ and $\rho_1^2 = -1$

$$m_1 = \frac{1}{2} \left[\sqrt{(m_L - m_R)^2 + 4 m_D^2} - (m_L + m_R) \right]$$

$$\rho_1 = i \text{ and } \rho_2 = 1 \quad \Rightarrow \quad U = \begin{pmatrix} i \cos \vartheta & \sin \vartheta \\ -i \sin \vartheta & \cos \vartheta \end{pmatrix}$$

- If Δm^2 is small, there are oscillations between active ν_a generated by ν_L and sterile ν_s generated by ν_R^C :

$$P_{\nu_a \rightarrow \nu_s}(L, E) = \sin^2 2\vartheta \sin^2 \left(\frac{\Delta m^2 L}{4E} \right)$$

$$\Delta m^2 = m_2^2 - m_1^2 = (m_L + m_R) \sqrt{(m_L - m_R)^2 + 4m_D^2}$$

- It can be shown that the CP parity of ν_k is $\xi_k^{\text{CP}} = i \rho_k^2$:

$$U_{\text{CP}} \nu_k(x) U_{\text{CP}}^{-1} = i \rho_k^2 \gamma^0 \nu_k(x_{\text{P}})$$

- Special cases:

- $m_L = m_R \implies$ Maximal Mixing
- $m_L = m_R = 0 \implies$ Dirac Limit
- $|m_L|, m_R \ll m_D \implies$ Pseudo-Dirac Neutrinos
- $m_L = 0 \quad m_D \ll m_R \implies$ See-Saw Mechanism

Maximal Mixing

$$m_L = m_R$$

$$\vartheta = \pi/4$$

$$m'_{2,1} = m_L \pm m_D$$

$$\begin{cases} \rho_1^2 = +1, & m_1 = m_L - m_D \quad \text{if} \quad m_L \geq m_D \\ \rho_1^2 = -1, & m_1 = m_D - m_L \quad \text{if} \quad m_L < m_D \\ & m_2 = m_L + m_D \end{cases}$$

$$\underline{m_L < m_D}$$

$$\begin{cases} \nu_{1L} = \frac{-i}{\sqrt{2}} (\nu_L - \nu_R^C) \\ \nu_{2L} = \frac{1}{\sqrt{2}} (\nu_L + \nu_R^C) \end{cases}$$

$$\begin{cases} \nu_1 = \nu_{1L} + \nu_{1L}^C = \frac{-i}{\sqrt{2}} [(\nu_L + \nu_R) - (\nu_L^C + \nu_R^C)] \\ \nu_2 = \nu_{2L} + \nu_{2L}^C = \frac{1}{\sqrt{2}} [(\nu_L + \nu_R) + (\nu_L^C + \nu_R^C)] \end{cases}$$

Dirac Limit

$$m_L = m_R = 0$$

- $m'_{2,1} = \pm m_D \implies \begin{cases} \rho_1^2 = -1, & m_1 = m_D \\ \rho_2^2 = +1, & m_2 = m_D \end{cases}$
- The two Majorana fields ν_1 and ν_2 can be combined to give one Dirac field:

$$\nu = \frac{1}{\sqrt{2}} (i\nu_1 + \nu_2) = \nu_L + \nu_R$$

- A Dirac field ν can always be split in two Majorana fields:

$$\begin{aligned} \nu &= \frac{1}{2} \left[(\nu - \nu^C) + (\nu + \nu^C) \right] \\ &= \frac{i}{\sqrt{2}} \left(-i \frac{\nu - \nu^C}{\sqrt{2}} \right) + \frac{1}{\sqrt{2}} \left(\frac{\nu + \nu^C}{\sqrt{2}} \right) = \frac{1}{\sqrt{2}} (i\nu_1 + \nu_2) \end{aligned}$$

- A Dirac field is equivalent to two Majorana fields with the same mass and opposite CP parities

Pseudo-Dirac Neutrinos

$$|m_L|, m_R \ll m_D$$

- ▶ $m'_{2,1} \simeq \frac{m_L + m_R}{2} \pm m_D$
- ▶ $m'_1 < 0 \implies \rho_1^2 = -1 \implies m_{2,1} \simeq m_D \pm \frac{m_L + m_R}{2}$
- ▶ The two massive Majorana neutrinos have opposite CP parities and are almost degenerate in mass
- ▶ The best way to reveal pseudo-Dirac neutrinos are active-sterile neutrino oscillations due to the small squared-mass difference

$$\Delta m^2 \simeq m_D (m_L + m_R)$$

- ▶ The oscillations occur with practically maximal mixing:

$$\tan 2\vartheta = \frac{2m_D}{m_R - m_L} \gg 1 \implies \vartheta \simeq \pi/4$$

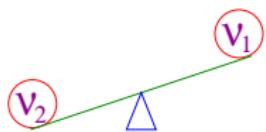

See-Saw Mechanism

[Minkowski, PLB 67 (1977) 42; Yanagida (1979); Gell-Mann, Ramond, Slansky (1979); Mohapatra, Senjanovic, PRL 44 (1980) 912]

$$m_L = 0 \quad m_D \ll m_R$$

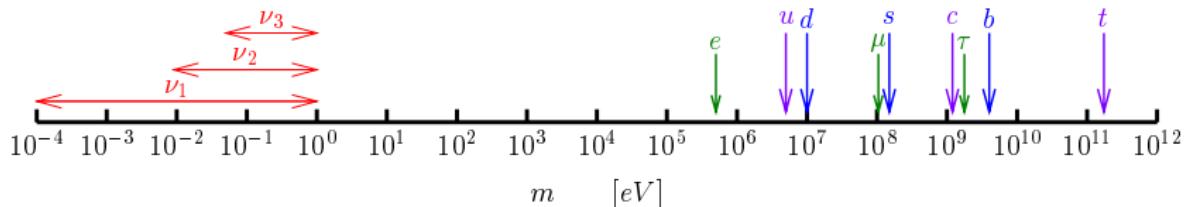

- $\mathcal{L}_{\text{mass}}^L$ is forbidden by SM symmetries $\Rightarrow m_L = 0$
- $m_D \lesssim v \sim 100 \text{ GeV}$ is generated by SM Higgs Mechanism (protected by SM symmetries)
- m_R is not protected by SM symmetries $\Rightarrow m_R \sim M_{\text{GUT}} \gg v$

$$\left. \begin{array}{l} m'_1 \simeq -\frac{m_D^2}{m_R} \\ m'_2 \simeq m_R \end{array} \right\} \Rightarrow \left\{ \begin{array}{l} \rho_1^2 = -1, \quad m_1 \simeq \frac{m_D^2}{m_R} \\ \rho_2^2 = +1, \quad m_2 \simeq m_R \end{array} \right.$$

- Natural explanation of smallness of neutrino masses
- Mixing angle is very small: $\tan 2\theta = 2 \frac{m_D}{m_R} \ll 1$
- ν_1 is composed mainly of active ν_L : $\nu_{1L} \simeq -i \nu_L$
- ν_2 is composed mainly of sterile ν_R : $\nu_{2L} \simeq \nu_R^C$

Majorana Neutrino Mass?

known natural explanation of smallness of ν masses

New High Energy Scale $\mathcal{M} \Rightarrow \begin{cases} \text{See-Saw Mechanism (if } \nu_R \text{'s exist)} \\ \text{5-D Non-Renormaliz. Eff. Operator} \end{cases}$

both imply $\begin{cases} \text{Majorana } \nu \text{ masses } \iff |\Delta L| = 2 \iff \beta\beta_{0\nu} \text{ decay} \\ \text{see-saw type relation } m_\nu \sim \frac{\mathcal{M}_{EW}^2}{\mathcal{M}} \end{cases}$

Majorana neutrino masses provide the most accessible window on New Physics Beyond the Standard Model

Right-Handed Neutrino Mass Term

Majorana mass term for ν_R respects the $SU(2)_L \times U(1)_Y$ Standard Model Symmetry!

$$\mathcal{L}_R^M = -\frac{1}{2} m \left(\overline{\nu_R^c} \nu_R + \overline{\nu_R} \nu_R^c \right)$$

Majorana mass term for ν_R breaks Lepton number conservation!

Three possibilities:

- ▶ Lepton number can be explicitly broken
- ▶ Lepton number is spontaneously broken locally, with a massive vector boson coupled to the lepton number current
- ▶ Lepton number is spontaneously broken globally and a massless Goldstone boson appears in the theory (Majoron)

Singlet Majoron Model

[Chikashige, Mohapatra, Peccei, Phys. Lett. B98 (1981) 265, Phys. Rev. Lett. 45 (1980) 1926]

$$\begin{aligned}\mathcal{L}_\Phi &= -y_d \left(\overline{L_L} \Phi \nu_R + \overline{\nu_R} \Phi^\dagger L_L \right) \xrightarrow[\langle \Phi \rangle \neq 0]{} -m_D (\overline{\nu_L} \nu_R + \overline{\nu_R} \nu_L) \\ \mathcal{L}_\eta &= -y_s \left(\eta \overline{\nu_R^c} \nu_R + \eta^\dagger \overline{\nu_R} \nu_R^c \right) \xrightarrow[\langle \eta \rangle \neq 0]{} -\frac{1}{2} m_R \left(\overline{\nu_R^c} \nu_R + \overline{\nu_R} \nu_R^c \right)\end{aligned}$$

$$\eta = 2^{-1/2} (\langle \eta \rangle + \rho + i \chi) \quad \mathcal{L}_{\text{mass}} = -\frac{1}{2} \left(\begin{smallmatrix} \overline{\nu_L^c} & \overline{\nu_R} \end{smallmatrix} \right) \left(\begin{smallmatrix} 0 & m_D \\ m_D & m_R \end{smallmatrix} \right) \left(\begin{smallmatrix} \nu_L \\ \nu_R^c \end{smallmatrix} \right) + \text{H.c.}$$

$\frac{m_R}{\text{scale of } L \text{ violation}} \gg \frac{m_D}{\text{EW scale}} \implies \text{See-Saw: } m_1 \simeq \frac{m_D^2}{m_R}$

ρ = massive scalar, χ = Majoron (massless pseudoscalar Goldstone boson)

The Majoron is weakly coupled to the light neutrino

$$\mathcal{L}_{\chi-\nu} = \frac{i y_s}{\sqrt{2}} \chi \left[\overline{\nu_2} \gamma^5 \nu_2 - \frac{m_D}{m_R} [\overline{\nu_2} \gamma^5 \nu_1 + \overline{\nu_1} \gamma^5 \nu_2] + \left(\frac{m_D}{m_R} \right)^2 \overline{\nu_1} \gamma^5 \nu_1 \right]$$

Three-Generation Mixing

$$\mathcal{L}_{\text{mass}}^{\text{D+M}} = \mathcal{L}_{\text{mass}}^{\text{D}} + \mathcal{L}_{\text{mass}}^{\text{L}} + \mathcal{L}_{\text{mass}}^{\text{R}}$$

$$\mathcal{L}_{\text{mass}}^{\text{D}} = - \sum_{s=1}^{N_S} \sum_{\alpha=e,\mu,\tau} \overline{\nu'_{sR}} M_{s\alpha}^{\text{D}} \nu'_{\alpha L} + \text{H.c.}$$

$$\mathcal{L}_{\text{mass}}^{\text{L}} = \frac{1}{2} \sum_{\alpha,\beta=e,\mu,\tau} \nu'^T_{\alpha L} C^\dagger M_{\alpha\beta}^{\text{L}} \nu'_{\beta L} + \text{H.c.}$$

$$\mathcal{L}_{\text{mass}}^{\text{R}} = \frac{1}{2} \sum_{s,s'=1}^{N_S} \nu'^T_{sR} C^\dagger M_{ss'}^{\text{R}} \nu'_{s'R} + \text{H.c.}$$

$$\mathbf{N}'_L \equiv \begin{pmatrix} \nu'_L \\ \nu'^C_R \end{pmatrix} \quad \nu'_L \equiv \begin{pmatrix} \nu'_{eL} \\ \nu'_{\mu L} \\ \nu'_{\tau L} \end{pmatrix} \quad \nu'^C_R \equiv \begin{pmatrix} \nu'_{1R} \\ \vdots \\ \nu'_{N_S R} \end{pmatrix}$$

$$\mathcal{L}_{\text{mass}}^{\text{D+M}} = \frac{1}{2} \mathbf{N}'^T_L C^\dagger M^{\text{D+M}} \mathbf{N}'_L + \text{H.c.} \quad M^{\text{D+M}} = \begin{pmatrix} M^{\text{L}} & M^{\text{D}^T} \\ M^{\text{D}} & M^{\text{R}} \end{pmatrix}$$

- ▶ Diagonalization of the Dirac-Majorana Mass Term \implies massive Majorana neutrinos
- ▶ See-Saw Mechanism \implies sterile right-handed neutrinos have large masses and are decoupled from the low-energy phenomenology
- ▶ At low energy we have an effective mixing of three Majorana neutrinos

Number of Massive Neutrinos?

$Z \rightarrow \nu \bar{\nu} \Rightarrow \nu_e \nu_\mu \nu_\tau$ active flavor neutrinos

mixing $\Rightarrow \nu_{\alpha L} = \sum_{k=1}^N U_{\alpha k} \nu_{kL}$ $\alpha = e, \mu, \tau$ $N \geq 3$
no upper limit!

Mass Basis:	ν_1	ν_2	ν_3	ν_4	ν_5	\dots

	ACTIVE			STERILE		

STERILE NEUTRINOS

singlets of SM \Rightarrow no interactions!

active \rightarrow sterile transitions are possible if ν_4, \dots are light (no see-saw)

disappearance of active neutrinos

Part II

Neutrino Oscillations in Vacuum and in Matter

Neutrino Oscillations in Vacuum

- Neutrino Oscillations in Vacuum
 - Ultrarelativistic Approximation
 - Easy Example of Neutrino Production
 - Neutrino Oscillations in Vacuum
 - Neutrinos and Antineutrinos
- CPT, CP and T Symmetries
- Two-Neutrino Oscillations
- Neutrino Oscillations in Matter

Ultrarelativistic Approximation

Only neutrinos with energy $\gtrsim 0.1 \text{ MeV}$ are detectable!

Charged-Current Processes: Threshold

$$\begin{aligned} \nu + A &\rightarrow B + C \\ \downarrow \\ s = 2E m_A + m_A^2 &\geq (m_B + m_C)^2 \\ \downarrow \\ E_{\text{th}} &= \frac{(m_B + m_C)^2}{2m_A} - \frac{m_A}{2} \end{aligned}$$

$$\begin{array}{lll} \nu_e + {}^{71}\text{Ga} \rightarrow {}^{71}\text{Ge} + e^- & E_{\text{th}} = 0.233 \text{ MeV} \\ \nu_e + {}^{37}\text{Cl} \rightarrow {}^{37}\text{Ar} + e^- & E_{\text{th}} = 0.81 \text{ MeV} \\ \bar{\nu}_e + p \rightarrow n + e^+ & E_{\text{th}} = 1.8 \text{ MeV} \\ \nu_\mu + n \rightarrow p + \mu^- & E_{\text{th}} = 110 \text{ MeV} \\ \nu_\mu + e^- \rightarrow \nu_e + \mu^- & E_{\text{th}} \simeq \frac{m_\mu^2}{2m_e} = 10.9 \text{ GeV} \end{array}$$

Elastic Scattering Processes: Cross Section \propto Energy

$$\nu + e^- \rightarrow \nu + e^- \quad \sigma(E) \sim \sigma_0 E/m_e \quad \sigma_0 \sim 10^{-44} \text{ cm}^2$$

Background $\implies E_{\text{th}} \simeq 5 \text{ MeV}$ (SK, SNO), 0.25 MeV (Borexino)

Laboratory and Astrophysical Limits \implies $m_\nu \lesssim 1 \text{ eV}$

Easy Example of Neutrino Production

$$\pi^+ \rightarrow \mu^+ + \nu_\mu$$

$$\nu_\mu = \sum_k U_{\mu k} \nu_k$$

two-body decay \implies fixed kinematics

$$E_k^2 = p_k^2 + m_k^2$$

π at rest:
$$\begin{cases} p_k^2 = \frac{m_\pi^2}{4} \left(1 - \frac{m_\mu^2}{m_\pi^2}\right)^2 - \frac{m_k^2}{2} \left(1 + \frac{m_\mu^2}{m_\pi^2}\right) + \frac{m_k^4}{4m_\pi^2} \\ E_k^2 = \frac{m_\pi^2}{4} \left(1 - \frac{m_\mu^2}{m_\pi^2}\right)^2 + \frac{m_k^2}{2} \left(1 - \frac{m_\mu^2}{m_\pi^2}\right) + \frac{m_k^4}{4m_\pi^2} \end{cases}$$

0^{th} order: $m_k = 0 \Rightarrow p_k = E_k = E = \frac{m_\pi}{2} \left(1 - \frac{m_\mu^2}{m_\pi^2}\right) \simeq 30 \text{ MeV}$

1^{st} order: $E_k \simeq E + \xi \frac{m_k^2}{2E}$

$p_k \simeq E - (1 - \xi) \frac{m_k^2}{2E}$

$$\xi = \frac{1}{2} \left(1 - \frac{m_\mu^2}{m_\pi^2}\right) \simeq 0.2$$

Neutrino Oscillations in Vacuum

[Eliezer, Swift, NPB 105 (1976) 45] [Fritzsch, Minkowski, PLB 62 (1976) 72] [Bilenky, Pontecorvo, SJNP 24 (1976) 316]

[Bilenky, Pontecorvo, Nuovo Cim. Lett. 17 (1976) 569] [Bilenky, Pontecorvo, Phys. Rep. 41 (1978) 225]

Flavor Neutrino Production: $j_{W,L}^\rho = 2 \sum_{\alpha=e,\mu,\tau} \overline{\nu_{\alpha L}} \gamma^\rho \ell_{\alpha L}$

$$\boxed{\nu_{\alpha L} = \sum_k U_{\alpha k} \nu_{kL}}$$

Fields $\overline{\nu_{\alpha L}} = \sum_k U_{\alpha k}^* \overline{\nu_{kL}}$ \Rightarrow States $|\nu_\alpha\rangle = \sum_k U_{\alpha k}^* |\nu_k\rangle$

$$|\nu_k(t, x)\rangle = e^{-iE_k t + ip_k x} |\nu_k\rangle \Rightarrow |\nu_\alpha(t, x)\rangle = \sum_k U_{\alpha k}^* e^{-iE_k t + ip_k x} |\nu_k\rangle$$

$$|\nu_k\rangle = \sum_{\beta=e,\mu,\tau} U_{\beta k} |\nu_\beta\rangle \Rightarrow |\nu_\alpha(t, x)\rangle = \sum_{\beta=e,\mu,\tau} \underbrace{\left(\sum_k U_{\alpha k}^* e^{-iE_k t + ip_k x} U_{\beta k} \right)}_{\mathcal{A}_{\nu_\alpha \rightarrow \nu_\beta}(t, x)} |\nu_\beta\rangle$$

Transition Probability

$$P_{\nu_\alpha \rightarrow \nu_\beta}(t, x) = |\langle \nu_\beta | \nu_\alpha(t, x) \rangle|^2 = |\mathcal{A}_{\nu_\alpha \rightarrow \nu_\beta}(t, x)|^2 = \left| \sum_k U_{\alpha k}^* e^{-iE_k t + ip_k x} U_{\beta k} \right|^2$$

ultra-relativistic neutrinos $\implies t \simeq x = L$ source-detector distance

$$E_k t - p_k x \simeq (E_k - p_k) L = \frac{E_k^2 - p_k^2}{E_k + p_k} L = \frac{m_k^2}{E_k + p_k} L \simeq \frac{m_k^2}{2E} L$$

$$\begin{aligned} P_{\nu_\alpha \rightarrow \nu_\beta}(L, E) &= \left| \sum_k U_{\alpha k}^* e^{-im_k^2 L/2E} U_{\beta k} \right|^2 \\ &= \sum_{k,j} U_{\alpha k}^* U_{\beta k} U_{\alpha j} U_{\beta j}^* \exp\left(-i \frac{\Delta m_{kj}^2 L}{2E}\right) \end{aligned}$$

$$\Delta m_{kj}^2 \equiv m_k^2 - m_j^2$$

$$\begin{aligned} P_{\nu_\alpha \rightarrow \nu_\beta}(L/E) &= \delta_{\alpha\beta} - 4 \sum_{k>j} \operatorname{Re} [U_{\alpha k}^* U_{\beta k} U_{\alpha j} U_{\beta j}^*] \sin^2\left(\frac{\Delta m_{kj}^2 L}{4E}\right) \\ &\quad + 2 \sum_{k>j} \operatorname{Im} [U_{\alpha k}^* U_{\beta k} U_{\alpha j} U_{\beta j}^*] \sin\left(\frac{\Delta m_{kj}^2 L}{2E}\right) \end{aligned}$$

Neutrinos and Antineutrinos

Antineutrinos are described by CP-conjugated fields:

$$\nu^{\text{CP}} = \gamma^0 \mathcal{C} \bar{\nu}^T = -\mathcal{C} \nu^*$$

C \implies Particle \leftrightarrows Antiparticle

P \implies Left-Handed \leftrightarrows Right-Handed

Fields: $\nu_{\alpha L} = \sum_k U_{\alpha k} \nu_{kL}$ $\xrightarrow{\text{CP}}$ $\nu_{\alpha L}^{\text{CP}} = \sum_k U_{\alpha k}^* \nu_{kL}^{\text{CP}}$

States: $|\nu_\alpha\rangle = \sum_k U_{\alpha k}^* |\nu_k\rangle$ $\xrightarrow{\text{CP}}$ $|\bar{\nu}_\alpha\rangle = \sum_k U_{\alpha k} |\bar{\nu}_k\rangle$

NEUTRINOS U \leftrightarrows U^* ANTINEUTRINOS

$$P_{\nu_\alpha \rightarrow \nu_\beta}(L, E) = \sum_k |U_{\alpha k}|^2 |U_{\beta k}|^2 + 2\text{Re} \sum_{k>j} U_{\alpha k}^* U_{\beta k} U_{\alpha j} U_{\beta j}^* \exp\left(-i \frac{\Delta m_{kj}^2 L}{2E}\right)$$

$$P_{\bar{\nu}_\alpha \rightarrow \bar{\nu}_\beta}(L, E) = \sum_k |U_{\alpha k}|^2 |U_{\beta k}|^2 + 2\text{Re} \sum_{k>j} U_{\alpha k} U_{\beta k}^* U_{\alpha j}^* U_{\beta j} \exp\left(-i \frac{\Delta m_{kj}^2 L}{2E}\right)$$

CPT, CP and T Symmetries

- Neutrino Oscillations in Vacuum
- CPT, CP and T Symmetries
 - CPT Symmetry
 - CP Symmetry
 - T Symmetry
- Two-Neutrino Oscillations
- Neutrino Oscillations in Matter

CPT Symmetry

$$P_{\nu_\alpha \rightarrow \nu_\beta} \xrightarrow{\text{CPT}} P_{\bar{\nu}_\beta \rightarrow \bar{\nu}_\alpha}$$

CPT Asymmetries: $A_{\alpha\beta}^{\text{CPT}} = P_{\nu_\alpha \rightarrow \nu_\beta} - P_{\bar{\nu}_\beta \rightarrow \bar{\nu}_\alpha}$

Local Quantum Field Theory $\implies A_{\alpha\beta}^{\text{CPT}} = 0$ CPT Symmetry

$$P_{\nu_\alpha \rightarrow \nu_\beta}(L, E) = \sum_k |U_{\alpha k}|^2 |U_{\beta k}|^2 + 2\text{Re} \sum_{k>j} U_{\alpha k}^* U_{\beta k} U_{\alpha j} U_{\beta j}^* \exp\left(-i \frac{\Delta m_{kj}^2 L}{2E}\right)$$

is invariant under CPT: $U \Leftrightarrow U^*$ $\alpha \Leftrightarrow \beta$

$$P_{\nu_\alpha \rightarrow \nu_\beta} = P_{\bar{\nu}_\beta \rightarrow \bar{\nu}_\alpha}$$

$$P_{\nu_\alpha \rightarrow \nu_\alpha} = P_{\bar{\nu}_\alpha \rightarrow \bar{\nu}_\alpha}$$

(solar ν_e , reactor $\bar{\nu}_e$, accelerator ν_μ)

CP Symmetry

$$P_{\nu_\alpha \rightarrow \nu_\beta} \xrightarrow{\text{CP}} P_{\bar{\nu}_\alpha \rightarrow \bar{\nu}_\beta}$$

CP Asymmetries: $A_{\alpha\beta}^{\text{CP}} = P_{\nu_\alpha \rightarrow \nu_\beta} - P_{\bar{\nu}_\alpha \rightarrow \bar{\nu}_\beta}$

CPT $\Rightarrow A_{\alpha\beta}^{\text{CP}} = -A_{\beta\alpha}^{\text{CP}}$

$$A_{\alpha\beta}^{\text{CP}}(L, E) = 2\text{Re} \sum_{k>j} U_{\alpha k}^* U_{\beta k} U_{\alpha j} U_{\beta j}^* \exp\left(-i \frac{\Delta m_{kj}^2 L}{2E}\right) - 2\text{Re} \sum_{k>j} U_{\alpha k} U_{\beta k}^* U_{\alpha j}^* U_{\beta j} \exp\left(-i \frac{\Delta m_{kj}^2 L}{2E}\right)$$

$$A_{\alpha\beta}^{\text{CP}}(L, E) = 4 \sum_{k>j} J_{\alpha\beta;kj} \sin\left(\frac{\Delta m_{kj}^2 L}{2E}\right)$$

Jarlskog invariants:

$$J_{\alpha\beta;kj} = \text{Im} \left[U_{\alpha k}^* U_{\beta k} U_{\alpha j} U_{\beta j}^* \right]$$

violation of CP symmetry depends only on Dirac phases
(three neutrinos: $J_{\alpha\beta;kj} = \pm c_{12}s_{12}c_{23}s_{23}c_{13}^2 s_{13} \sin \delta_{13}$)

$\langle A_{\alpha\beta}^{\text{CP}} \rangle = 0 \Rightarrow$ observation of CP violation needs measurement of oscillations

T Symmetry

$$P_{\nu_\alpha \rightarrow \nu_\beta} \xrightarrow{\text{T}} P_{\bar{\nu}_\beta \rightarrow \bar{\nu}_\alpha}$$

T Asymmetries: $A_{\alpha\beta}^T = P_{\nu_\alpha \rightarrow \nu_\beta} - P_{\bar{\nu}_\beta \rightarrow \bar{\nu}_\alpha}$

CPT $\implies 0 = A_{\alpha\beta}^{\text{CPT}} = P_{\nu_\alpha \rightarrow \nu_\beta} - P_{\bar{\nu}_\beta \rightarrow \bar{\nu}_\alpha}$
 $= P_{\nu_\alpha \rightarrow \nu_\beta} - P_{\nu_\beta \rightarrow \nu_\alpha} + P_{\nu_\beta \rightarrow \nu_\alpha} - P_{\bar{\nu}_\beta \rightarrow \bar{\nu}_\alpha}$
 $= A_{\alpha\beta}^T + A_{\beta\alpha}^{\text{CP}} = A_{\alpha\beta}^T - A_{\alpha\beta}^{\text{CP}} \implies A_{\alpha\beta}^T = A_{\alpha\beta}^{\text{CP}}$

$$A_{\alpha\beta}^T(L, E) = 4 \sum_{k>j} J_{\alpha\beta;kj} \sin\left(\frac{\Delta m_{kj}^2 L}{2E}\right)$$

violation of T symmetry depends only on Dirac phases

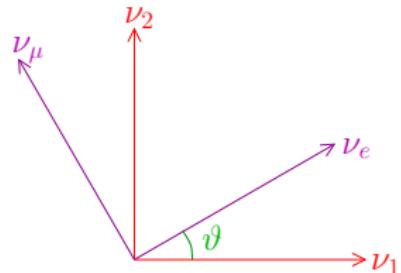

$\langle A_{\alpha\beta}^T \rangle = 0 \implies$ observation of T violation needs measurement of oscillations

Two-Neutrino Oscillations

- Neutrino Oscillations in Vacuum
- CPT, CP and T Symmetries
- Two-Neutrino Oscillations
 - Two-Neutrino Mixing and Oscillations
 - Types of Experiments
 - Average over Energy Resolution of the Detector
 - Anatomy of Exclusion Plots
- Neutrino Oscillations in Matter

Two-Neutrino Mixing and Oscillations

$$|\nu_\alpha\rangle = \sum_{k=1}^2 U_{\alpha k} |\nu_k\rangle \quad (\alpha = e, \mu)$$

$$U = \begin{pmatrix} \cos \vartheta & \sin \vartheta \\ -\sin \vartheta & \cos \vartheta \end{pmatrix}$$

$$\boxed{\begin{aligned} |\nu_e\rangle &= \cos \vartheta |\nu_1\rangle + \sin \vartheta |\nu_2\rangle \\ |\nu_\mu\rangle &= -\sin \vartheta |\nu_1\rangle + \cos \vartheta |\nu_2\rangle \end{aligned}}$$

$$\Delta m^2 \equiv \Delta m_{21}^2 \equiv m_2^2 - m_1^2$$

Transition Probability:

$$P_{\nu_e \rightarrow \nu_\mu} = P_{\nu_\mu \rightarrow \nu_e} = \sin^2 2\vartheta \sin^2 \left(\frac{\Delta m^2 L}{4E} \right)$$

Survival Probabilities:

$$P_{\nu_e \rightarrow \nu_e} = P_{\nu_\mu \rightarrow \nu_\mu} = 1 - P_{\nu_e \rightarrow \nu_\mu}$$

two-neutrino mixing transition probability

$$\alpha \neq \beta \quad \alpha, \beta = e, \mu, \tau$$

$$\begin{aligned} P_{\nu_\alpha \rightarrow \nu_\beta}(L, E) &= \sin^2 2\vartheta \sin^2 \left(\frac{\Delta m^2 L}{4E} \right) \\ &= \sin^2 2\vartheta \sin^2 \left(1.27 \frac{\Delta m^2 [\text{eV}^2] L [\text{m}]}{E [\text{MeV}]} \right) \\ &= \sin^2 2\vartheta \sin^2 \left(1.27 \frac{\Delta m^2 [\text{eV}^2] L [\text{km}]}{E [\text{GeV}]} \right) \end{aligned}$$

oscillation length

$$L^{\text{osc}} = \frac{4\pi E}{\Delta m^2} = 2.47 \frac{E [\text{MeV}]}{\Delta m^2 [\text{eV}^2]} \text{ m} = 2.47 \frac{E [\text{GeV}]}{\Delta m^2 [\text{eV}^2]} \text{ km}$$

Types of Experiments

Matter Effects

a flavor neutrino ν_α with momentum p is described by

$$|\nu_\alpha(p)\rangle = \sum_k U_{\alpha k}^* |\nu_k(p)\rangle$$

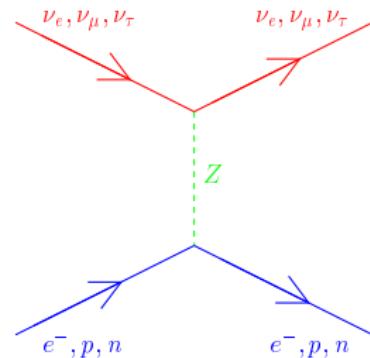

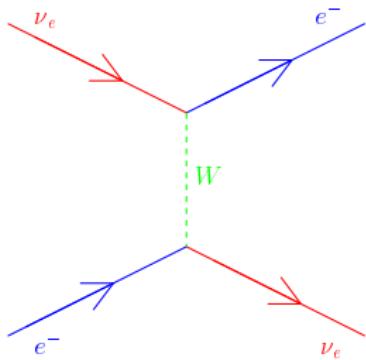

$$\mathcal{H}_0 |\nu_k(p)\rangle = E_k |\nu_k(p)\rangle \quad E_k = \sqrt{p^2 + m_k^2}$$

$$\text{in matter} \quad \mathcal{H} = \mathcal{H}_0 + \mathcal{H}_I \quad \mathcal{H}_I |\nu_\alpha(p)\rangle = V_\alpha |\nu_\alpha(p)\rangle$$

V_α = effective potential due to coherent interactions with the medium

forward elastic CC and NC scattering

Effective Potentials in Matter

$$V_{CC} = \sqrt{2} G_F N_e$$

$$V_{NC}^{(e^-)} = -V_{NC}^{(p)} \Rightarrow$$

$$V_{NC} = V_{NC}^{(n)} = -\frac{\sqrt{2}}{2} G_F N_n$$

$$V_e = V_{CC} + V_{NC} \quad V_\mu = V_\tau = V_{NC} \quad (\text{common phase})$$

$$V_e - V_\mu = V_{CC}$$

antineutrinos: $\bar{V}_{CC} = -V_{CC}$ $\bar{V}_{NC} = -V_{NC}$

Evolution of Neutrino Flavors in Matter

Schrödinger picture: $i \frac{d}{dt} |\nu_\alpha(p, t)\rangle = \mathcal{H}|\nu_\alpha(p, t)\rangle, \quad |\nu_\alpha(p, 0)\rangle = |\nu_\alpha(p)\rangle$

flavor transition amplitudes: $\varphi_{\alpha\beta}(p, t) = \langle \nu_\beta(p) | \nu_\alpha(p, t) \rangle, \quad \varphi_{\alpha\beta}(p, 0) = \delta_{\alpha\beta}$

$$i \frac{d}{dt} \varphi_{\alpha\beta}(p, t) = \langle \nu_\beta(p) | \mathcal{H} | \nu_\alpha(p, t) \rangle = \langle \nu_\beta(p) | \mathcal{H}_0 | \nu_\alpha(p, t) \rangle + \langle \nu_\beta(p) | \mathcal{H}_I | \nu_\alpha(p, t) \rangle$$

$$\begin{aligned} \langle \nu_\beta(p) | \mathcal{H}_0 | \nu_\alpha(p, t) \rangle &= \sum_{\rho} \langle \nu_\beta(p) | \mathcal{H}_0 | \nu_\rho(p) \rangle \underbrace{\langle \nu_\rho(p) | \nu_\alpha(p, t) \rangle}_{\varphi_{\alpha\rho}(p, t)} \\ &= \sum_{\rho} \sum_{k,j} U_{\beta k} \underbrace{\langle \nu_k(p) | \mathcal{H}_0 | \nu_j(p) \rangle}_{\delta_{kj} E_k} U_{\rho j}^* \varphi_{\alpha\rho}(p, t) \end{aligned}$$

$$\langle \nu_\beta(p) | \mathcal{H}_I | \nu_\alpha(p, t) \rangle = \sum_{\rho} \underbrace{\langle \nu_\beta(p) | \mathcal{H}_I | \nu_\rho(p) \rangle}_{\delta_{\beta\rho} V_\beta} \varphi_{\alpha\rho}(p, t) = V_\beta \varphi_{\alpha\beta}(p, t)$$

conservation of probability (unitarity)

$$|\mathcal{A}_{12}^R|^2 = |\mathcal{A}_{21}^R|^2 = P_c \qquad \qquad |\mathcal{A}_{11}^R|^2 = |\mathcal{A}_{22}^R|^2 = 1 - P_c$$

$P_c \equiv$ crossing probability

$$\boxed{\bar{P}_{\nu_e \rightarrow \nu_e}(x) = \frac{1}{2} + \left(\frac{1}{2} - P_c\right) \cos 2\vartheta_M^0 \cos 2\vartheta_M^x}$$

[Parke, PRL 57 (1986) 1275]

Crossing Probability

$$P_c = \frac{\exp\left(-\frac{\pi}{2}\gamma F\right) - \exp\left(-\frac{\pi}{2}\gamma \frac{F}{\sin^2 \vartheta}\right)}{1 - \exp\left(-\frac{\pi}{2}\gamma \frac{F}{\sin^2 \vartheta}\right)}$$

[Kuo, Pantaleone, PRD 39 (1989) 1930]

adiabaticity parameter:

$$\gamma = \frac{\Delta m_M^2 / 2E}{2|d\vartheta_M/dx|} \Bigg|_R = \frac{\Delta m^2 \sin^2 2\vartheta}{2E \cos 2\vartheta \left| \frac{d \ln A_{CC}}{dx} \right|_R}$$

$$A \propto x \quad F = 1 \text{ (Landau-Zener approximation)} \quad [\text{Parke, PRL 57 (1986) 1275}]$$

$$A \propto 1/x \quad F = (1 - \tan^2 \vartheta)^2 / (1 + \tan^2 \vartheta) \quad [\text{Kuo, Pantaleone, PRD 39 (1989) 1930}]$$

$$A \propto \exp(-x) \quad F = 1 - \tan^2 \vartheta \quad [\text{Toshev, PLB 196 (1987) 170}]$$

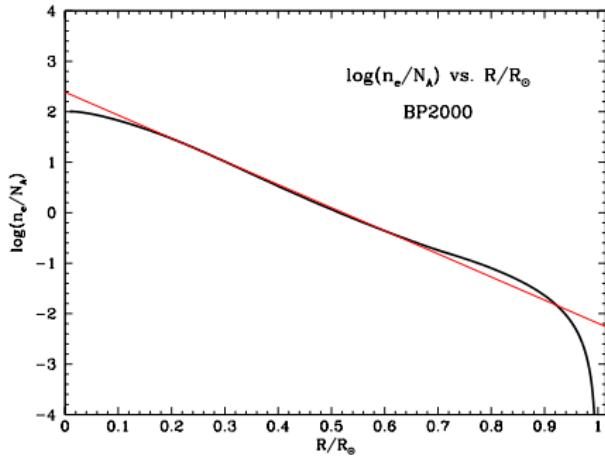

[Pizzochero, PRD 36 (1987) 2293]

[Petcov, PLB 200 (1988) 373]

Review: [Kuo, Pantaleone, RMP 61 (1989) 937]

Solar Neutrinos

SUN: $N_e(x) \simeq N_e^c \exp\left(-\frac{x}{x_0}\right)$ $N_e^c = 245 \text{ } N_A/\text{cm}^3$ $x_0 = \frac{R_\odot}{10.54}$

$$\overline{P}_{\nu_e \rightarrow \nu_e}^{\text{sun}} = \frac{1}{2} + \left(\frac{1}{2} - P_c \right) \cos 2\vartheta_M^0 \cos 2\vartheta$$

$$P_c = \frac{\exp\left(-\frac{\pi}{2}\gamma F\right) - \exp\left(-\frac{\pi}{2}\gamma \frac{F}{\sin^2 \vartheta}\right)}{1 - \exp\left(-\frac{\pi}{2}\gamma \frac{F}{\sin^2 \vartheta}\right)}$$

$$\gamma = \frac{\Delta m^2 \sin^2 2\vartheta}{2E \cos 2\vartheta \left| \frac{d \ln A_{CC}}{dx} \right|_R}$$

$$F = 1 - \tan^2 \vartheta$$

$$A_{CC} = 2\sqrt{2} E G_F N_e$$

practical prescription:

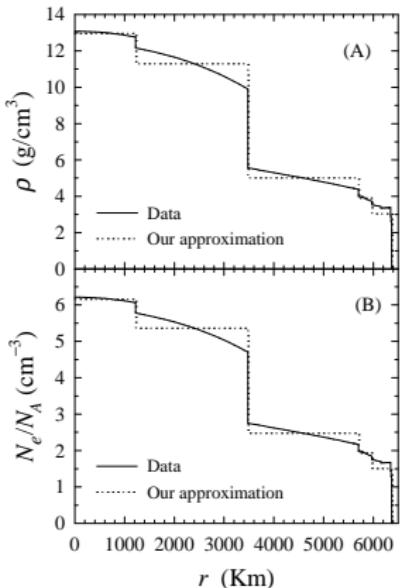

[Lisi et al., PRD 63 (2001) 093002]

$$\left\{ \begin{array}{ll} \text{numerical } \left| \frac{d \ln A_{CC}}{dx} \right|_R & \text{for } x \leq 0.904 R_\odot \\ \left| \frac{d \ln A_{CC}}{dx} \right|_R \rightarrow \frac{18.9}{R_\odot} & \text{for } x > 0.904 R_\odot \end{array} \right.$$

Electron Neutrino Regeneration in the Earth

$$P_{\nu_e \rightarrow \nu_e}^{\text{sun+earth}} = P_{\nu_e \rightarrow \nu_e}^{\text{sun}} + \frac{(1 - 2\bar{P}_{\nu_e \rightarrow \nu_e}^{\text{sun}}) (P_{\nu_2 \rightarrow \nu_e}^{\text{earth}} - \sin^2 \vartheta)}{\cos 2\vartheta}$$

[Mikheev, Smirnov, Sov. Phys. Usp. 30 (1987) 759], [Baltz, Weneser, PRD 35 (1987) 528]

$P_{\nu_2 \rightarrow \nu_e}^{\text{earth}}$ is usually calculated numerically approximating the Earth density profile with a step function.

Effective massive neutrinos propagate as plane waves in regions of constant density.

Wave functions of flavor neutrinos are joined at the boundaries of steps.

[Giunti, Kim, Monteno, NP B 521 (1998) 3]

Phenomenology of Solar Neutrinos

LMA (Large Mixing Angle):

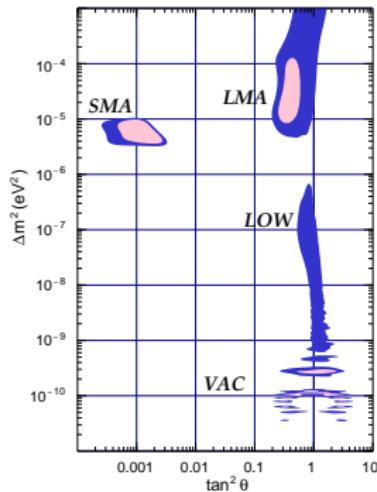

LOW (LOW Δm^2):

SMA (Small Mixing Angle):

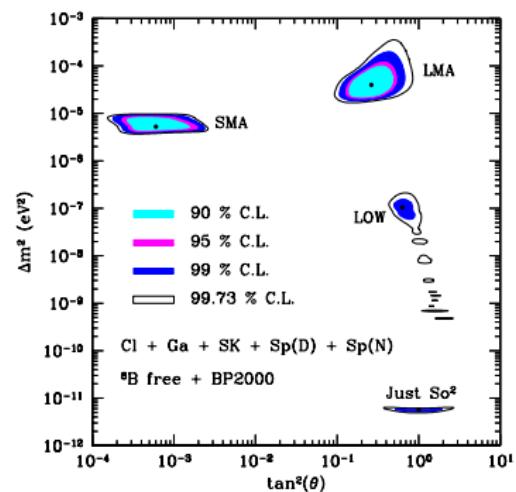

QVO (Quasi-Vacuum Oscillations):

VAC (VACuum oscillations):

Large Mixing Angle solution

$$\Delta m^2 \simeq 7 \times 10^{-5} \text{ eV}^2$$

$$\tan^2 \vartheta \simeq 0.45$$

[SNO, PRC 72 (2005) 055502, nucl-ex/0502021]

KamLAND

Kamioka Liquid scintillator Anti-Neutrino Detector long-baseline reactor $\bar{\nu}_e$ experiment

Kamioka mine (200 km west of Tokyo), 1000 m underground, 2700 m.w.e.

6.7% of flux from one reactor at 88 km

average distance from reactors: 180 km 79% of flux from 26 reactors at 138–214 km
14.3% of flux from other reactors at >295 km

1 kt liquid scintillator detector: $\bar{\nu}_e + p \rightarrow e^+ + n$, energy threshold: $E_{\text{th}}^{\bar{\nu}_e p} = 1.8 \text{ MeV}$

data taking: 4 March – 6 October 2002, 145.1 days (162 ton yr)

expected number of reactor neutrino events (no osc.):

$$N_{\text{expected}}^{\text{KamLAND}} = 86.8 \pm 5.6$$

expected number of background events:

$$N_{\text{background}}^{\text{KamLAND}} = 0.95 \pm 0.99$$

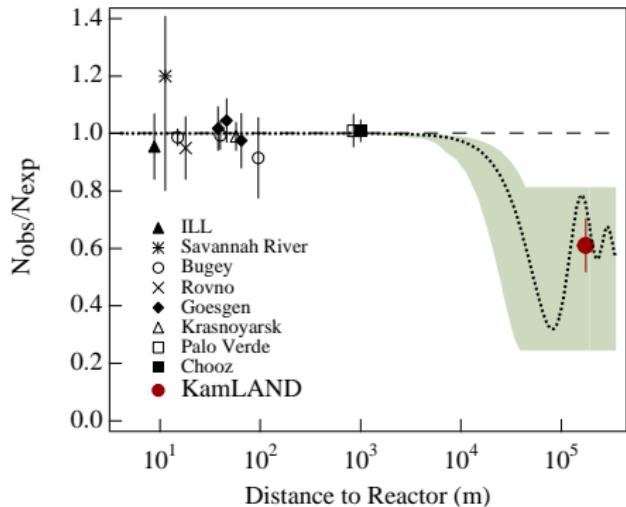

observed number of neutrino events:

$$N_{\text{observed}}^{\text{KamLAND}} = 54$$

$$\frac{N_{\text{observed}}^{\text{KamLAND}} - N_{\text{background}}^{\text{KamLAND}}}{N_{\text{expected}}^{\text{KamLAND}}} = 0.611 \pm 0.085 \pm 0.041$$

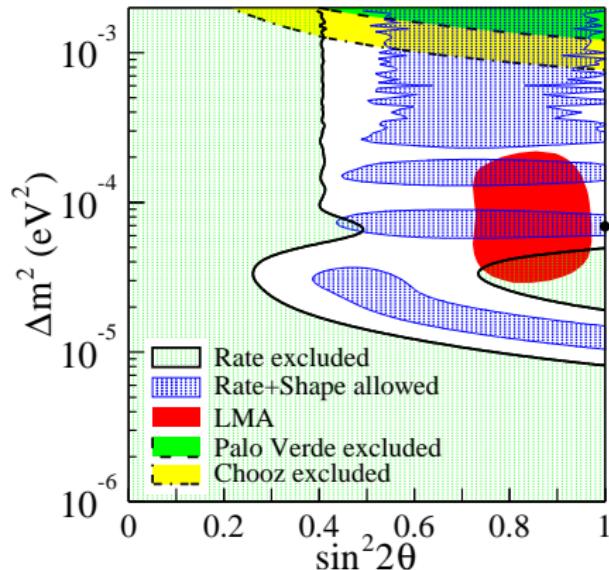

99.95% C.L. evidence
of $\bar{\nu}_e$ disappearance

confirmation of LMA (December 2002)

Shade: 95% C.L. LMA

Curve: $\left\{ \begin{array}{l} \Delta m^2 = 5.5 \times 10^{-5} \text{ eV}^2 \\ \sin^2 2\vartheta = 0.83 \end{array} \right.$

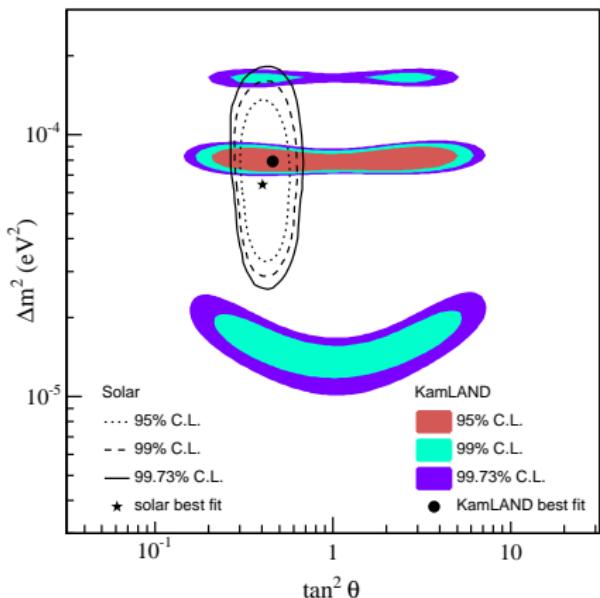

95% C.L.

Details of Solar Neutrino Oscillations

best fit of reactor + solar neutrino data: $\Delta m^2 \simeq 7 \times 10^{-5} \text{ eV}^2$ $\tan^2 \vartheta \simeq 0.4$

$$\boxed{\overline{P}_{\nu_e \rightarrow \nu_e}^{\text{sun}} = \frac{1}{2} + \left(\frac{1}{2} - P_c \right) \cos 2\vartheta_M^0 \cos 2\vartheta}$$

$$P_c = \frac{\exp\left(-\frac{\pi}{2}\gamma F\right) - \exp\left(-\frac{\pi}{2}\gamma \frac{F}{\sin^2 \vartheta}\right)}{1 - \exp\left(-\frac{\pi}{2}\gamma \frac{F}{\sin^2 \vartheta}\right)} \quad \gamma = \frac{\Delta m^2 \sin^2 2\vartheta}{2E \cos 2\vartheta \left| \frac{d \ln A}{dx} \right|_R} \quad F = 1 - \tan^2 \vartheta$$

$$A_{CC} \simeq 2\sqrt{2}EG_F N_e^c \exp\left(-\frac{x}{x_0}\right) \implies \left| \frac{d \ln A}{dx} \right| \simeq \frac{1}{x_0} = \frac{10.54}{R_\odot} \simeq 3 \times 10^{-15} \text{ eV}$$

$$\tan^2 \vartheta \simeq 0.4 \implies \sin^2 2\vartheta \simeq 0.82, \cos 2\vartheta \simeq 0.43 \quad \gamma \simeq 2 \times 10^4 \left(\frac{E}{\text{MeV}} \right)^{-1}$$

$$\gamma \gg 1 \implies P_c \ll 1 \implies \boxed{\overline{P}_{\nu_e \rightarrow \nu_e}^{\text{sun,LMA}} \simeq \frac{1}{2} + \frac{1}{2} \cos 2\vartheta_M^0 \cos 2\vartheta}$$

$$\cos^2\vartheta_M^0 = \frac{\Delta m^2 \cos 2\vartheta - A_{CC}^0}{\sqrt{(\Delta m^2 \cos 2\vartheta - A_{CC}^0)^2 + (\Delta m^2 \sin 2\vartheta)^2}}$$

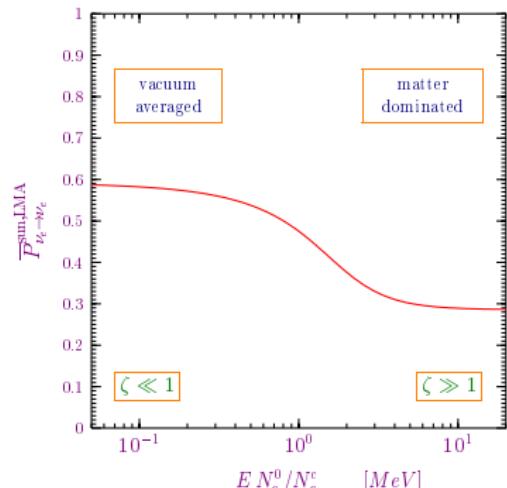

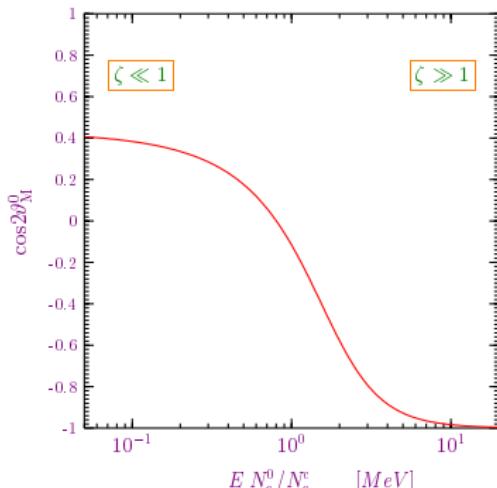

critical parameter [Bahcall, Peña-Garay, hep-ph/0305159]

$$\zeta = \frac{A_{CC}^0}{\Delta m^2 \cos 2\vartheta} = \frac{2\sqrt{2}EG_F N_e^0}{\Delta m^2 \cos 2\vartheta} \simeq 1.2 \left(\frac{E}{\text{MeV}} \right) \left(\frac{N_e^0}{N_e^c} \right)$$

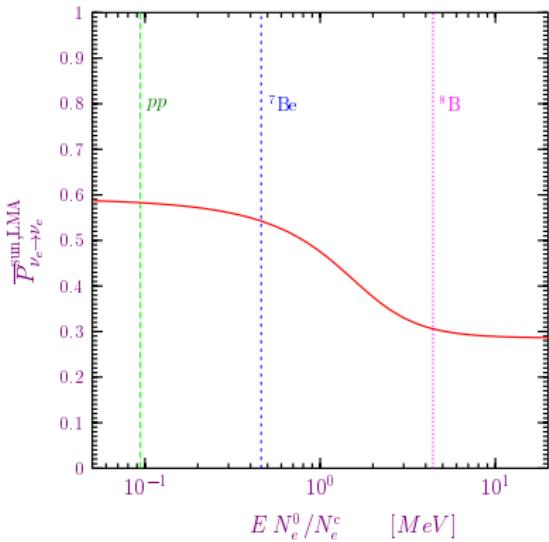

$$\zeta \ll 1 \implies \vartheta_M^0 \simeq \vartheta \implies \bar{P}_{\nu_e \rightarrow \nu_e}^{\text{sun}} \simeq 1 - \frac{1}{2} \sin^2 2\vartheta$$

vacuum averaged
survival probability
matter dominated
survival probability

$$\zeta \gg 1 \implies \vartheta_M^0 \simeq \pi/2 \implies \bar{P}_{\nu_e \rightarrow \nu_e}^{\text{sun}} \simeq \sin^2 \vartheta$$

$$\begin{aligned} \langle E \rangle_{pp} &\simeq 0.27 \text{ MeV}, \langle r_0 \rangle_{pp} \simeq 0.1 R_\odot & \Rightarrow \langle E N_e^0 / N_e^c \rangle_{pp} &\simeq 0.094 \text{ MeV} \\ E_{^7\text{Be}} &\simeq 0.86 \text{ MeV}, \langle r_0 \rangle_{^7\text{Be}} \simeq 0.06 R_\odot & \Rightarrow \langle E N_e^0 / N_e^c \rangle_{^7\text{Be}} &\simeq 0.46 \text{ MeV} \\ \langle E \rangle_{^8\text{B}} &\simeq 6.7 \text{ MeV}, \langle r_0 \rangle_{^8\text{B}} \simeq 0.04 R_\odot & \Rightarrow \langle E N_e^0 / N_e^c \rangle_{^8\text{B}} &\simeq 4.4 \text{ MeV} \end{aligned}$$

each neutrino experiment is mainly sensitive to one flux
 each neutrino experiment is mainly sensitive to ϑ
 accurate *pp* experiment can improve determination of ϑ

[Bahcall, Peña-Garay, hep-ph/0305159]

Future

Goals of Future Solar Neutrino Experiments

[Bahcall, Peña-Garay, hep-ph/0305159]

- ▶ Improve the determination of ϑ
- ▶ Accurate measure of solar neutrino fluxes
- ▶ Discover or constraint subdominant neutrino conversion mechanisms

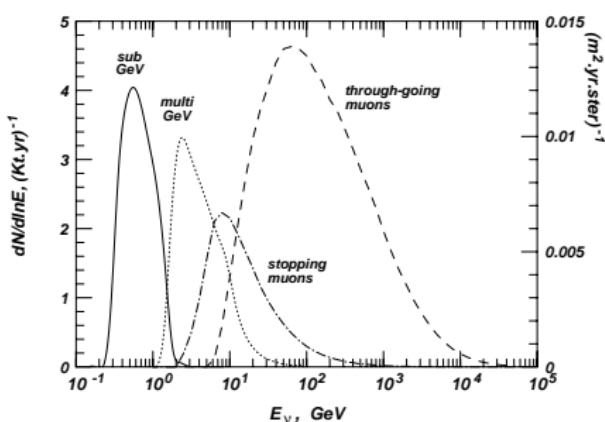

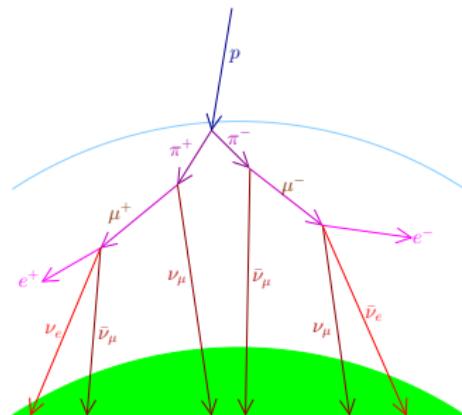

Precise Determination of Δm^2 with New Reactor Experiment

LMA: $L \simeq 70 - 80$ km

inverted scheme

$$m_2^2 = m_1^2 + \Delta m_{21}^2 = m_1^2 + \Delta m_{\text{SOL}}^2$$
$$m_3^2 = m_1^2 + \Delta m_{31}^2 = m_1^2 + \Delta m_{\text{ATM}}^2$$

$$m_1^2 = m_3^2 - \Delta m_{31}^2 = m_3^2 + \Delta m_{\text{ATM}}^2$$
$$m_2^2 = m_1^2 + \Delta m_{21}^2 \simeq m_3^2 + \Delta m_{\text{ATM}}^2$$

Quasi-Degenerate for $m_1 \simeq m_2 \simeq m_3 \simeq m_\nu \gg \sqrt{\Delta m_{\text{ATM}}^2} \simeq 5 \times 10^{-2} \text{ eV}$

Tritium Beta-Decay

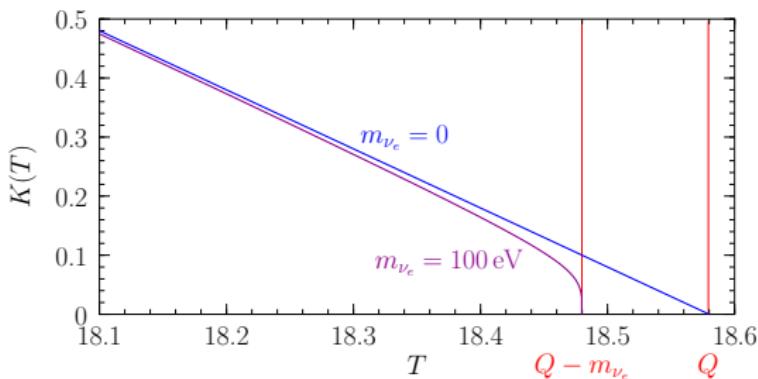

$$\frac{d\Gamma}{dT} = \frac{(\cos\vartheta_C G_F)^2}{2\pi^3} |\mathcal{M}|^2 F(E) pE (Q - T) \sqrt{(Q - T)^2 - m_{\nu_e}^2}$$

$$Q = M_{^3\text{H}} - M_{^3\text{He}} - m_e = 18.58 \text{ keV}$$

Kurie plot

$$K(T) = \sqrt{\frac{d\Gamma/dT}{\frac{(\cos\vartheta_C G_F)^2}{2\pi^3} |\mathcal{M}|^2 F(E) pE}} = \left[(Q - T) \sqrt{(Q - T)^2 - m_{\nu_e}^2} \right]^{1/2}$$

$m_{\nu_e} < 2.2 \text{ eV} \quad (95\% \text{ C.L.})$

Mainz & Troitsk

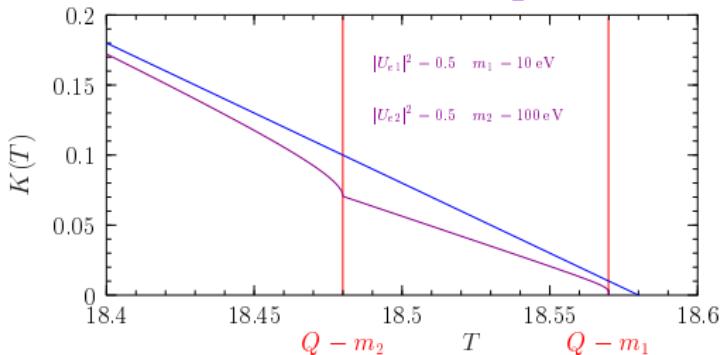

[Weinheimer, hep-ex/0210050]

future: KATRIN (start 2010)

[hep-ex/0109033] [hep-ex/0309007]

sensitivity: $m_{\nu_e} \simeq 0.2 \text{ eV}$

Neutrino Mixing $\implies K(T) = \left[(Q - T) \sum_k |U_{ek}|^2 \sqrt{(Q - T)^2 - m_k^2} \right]^{1/2}$

analysis of data is different from the no-mixing case:

$2N - 1$ parameters

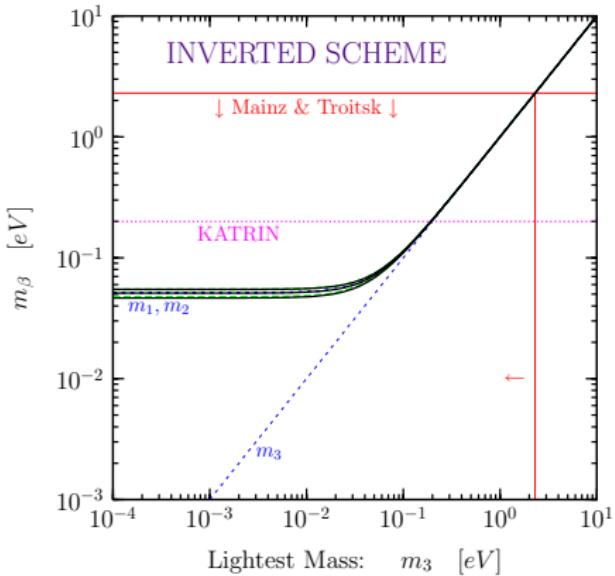

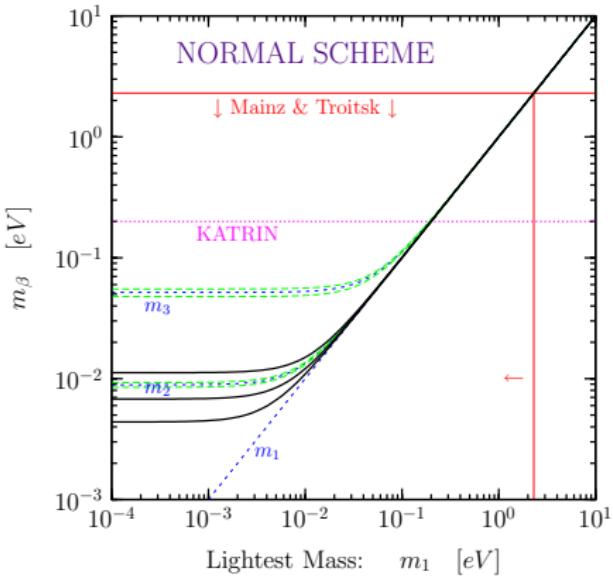

$$\left(\sum_k |U_{ek}|^2 = 1 \right)$$

if experiment is not sensitive to masses ($m_k \ll Q - T$)

effective mass:
$$m_\beta^2 = \sum_k |U_{ek}|^2 m_k^2$$

$$\begin{aligned} K^2 &= (Q - T)^2 \sum_k |U_{ek}|^2 \sqrt{1 - \frac{m_k^2}{(Q - T)^2}} \simeq (Q - T)^2 \sum_k |U_{ek}|^2 \left[1 - \frac{1}{2} \frac{m_k^2}{(Q - T)^2} \right] \\ &= (Q - T)^2 \left[1 - \frac{1}{2} \frac{m_\beta^2}{(Q - T)^2} \right] \simeq (Q - T) \sqrt{(Q - T)^2 - m_\beta^2} \end{aligned}$$

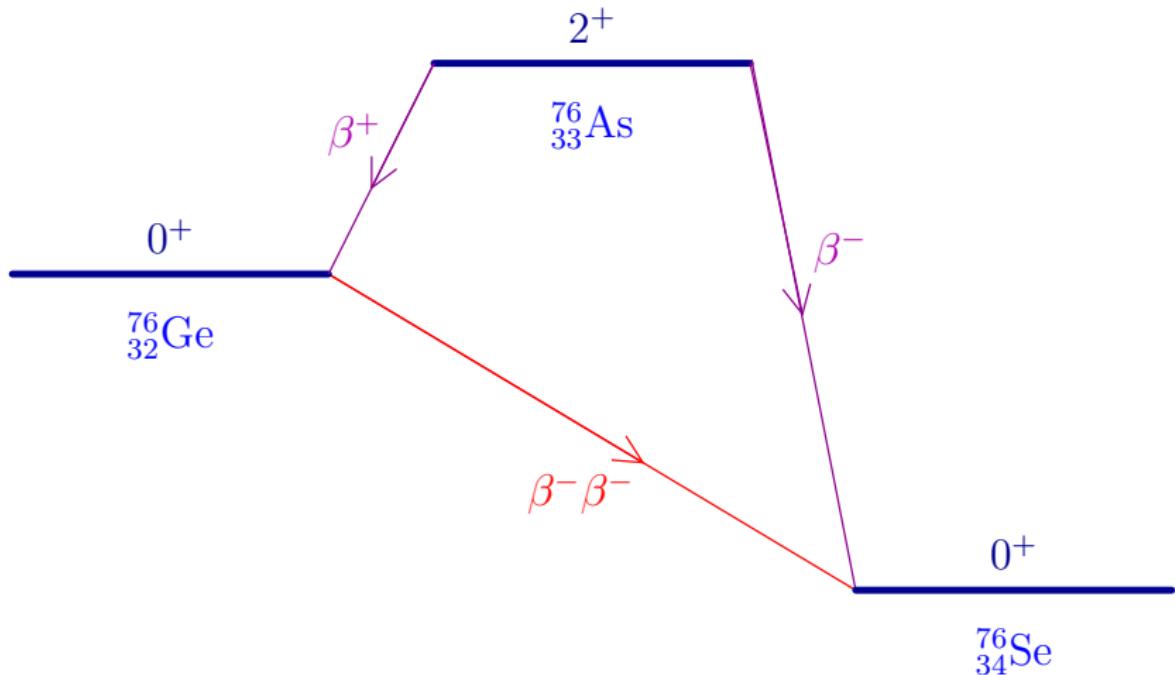

$$m_\beta^2 = |U_{e1}|^2 m_1^2 + |U_{e2}|^2 m_2^2 + |U_{e3}|^2 m_3^2$$

Quasi-Degenerate: $m_1 \simeq m_2 \simeq m_3 \simeq m_\nu \implies m_\beta^2 \simeq m_\nu^2 \sum_k |U_{ek}|^2 = m_\nu^2$

FUTURE: IF $m_\beta \lesssim 4 \times 10^{-2}$ eV \implies NORMAL HIERARCHY

Neutrinoless Double-Beta Decay

Effective Majorana Neutrino Mass:

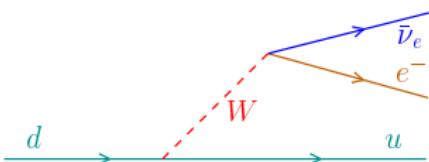

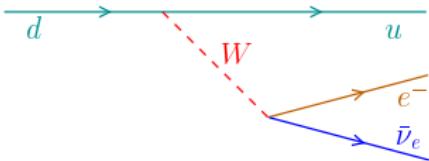

$$m_{\beta\beta} = \sum_k U_{ek}^2 m_k$$

Two-Neutrino Double- β Decay: $\Delta L = 0$

$$\mathcal{N}(A, Z) \rightarrow \mathcal{N}(A, Z+2) + e^- + e^- + \bar{\nu}_e + \bar{\nu}_e$$

$$(T_{1/2}^{2\nu})^{-1} = G_{2\nu} |\mathcal{M}_{2\nu}|^2$$

second order weak interaction process
in the Standard Model

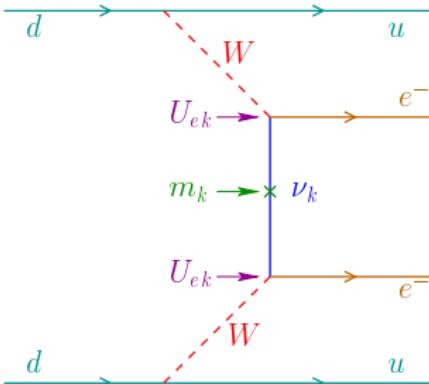

Neutrinoless Double- β Decay: $\Delta L = 2$

$$\mathcal{N}(A, Z) \rightarrow \mathcal{N}(A, Z+2) + e^- + e^-$$

$$(T_{1/2}^{0\nu})^{-1} = G_{0\nu} |\mathcal{M}_{0\nu}|^2 |m_{\beta\beta}|^2$$

effective
Majorana
mass

$$m_{\beta\beta} = \sum_k U_{ek}^2 m_k$$

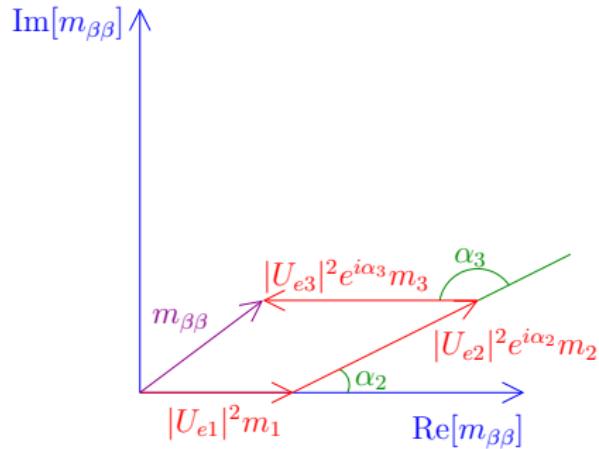

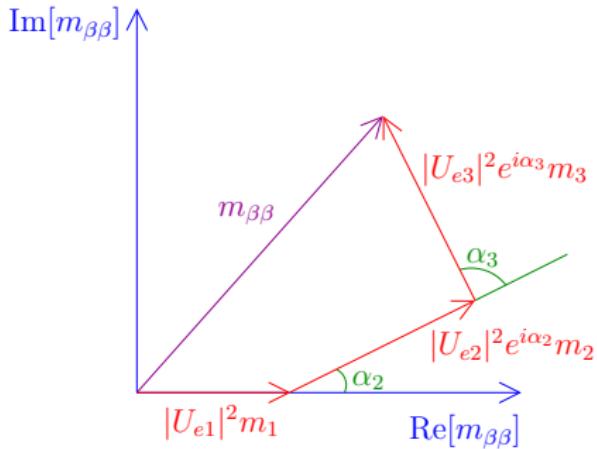

Effective Majorana Neutrino Mass

$$m_{\beta\beta} = \sum_k U_{ek}^2 m_k \quad \text{complex } U_{ek} \Rightarrow \text{possible cancellations}$$

$$m_{\beta\beta} = |U_{e1}|^2 m_1 + |U_{e2}|^2 e^{i\alpha_2} m_2 + |U_{e3}|^2 e^{i\alpha_3} m_3$$

$$\alpha_2 = 2\lambda_2 \quad \alpha_3 = 2(\lambda_3 - \delta_{13})$$

Experimental Bounds

CUORICINO (^{130}Te) [PRC 78 (2008) 035502]

$$T_{1/2}^{0\nu} > 3 \times 10^{24} \text{ y} \quad (90\% \text{ C.L.}) \implies |m_{\beta\beta}| \lesssim 0.19 - 0.68 \text{ eV}$$

Heidelberg-Moscow (^{76}Ge) [EPJA 12 (2001) 147]

$$T_{1/2}^{0\nu} > 1.9 \times 10^{25} \text{ y} \quad (90\% \text{ C.L.}) \implies |m_{\beta\beta}| \lesssim 0.32 - 1.0 \text{ eV}$$

IGEX (^{76}Ge) [PRD 65 (2002) 092007]

$$T_{1/2}^{0\nu} > 1.57 \times 10^{25} \text{ y} \quad (90\% \text{ C.L.}) \implies |m_{\beta\beta}| \lesssim 0.33 - 1.35 \text{ eV}$$

NEMO 3 (^{100}Mo) [PRL 95 (2005) 182302]

$$T_{1/2}^{0\nu} > 4.6 \times 10^{23} \text{ y} \quad (90\% \text{ C.L.}) \implies |m_{\beta\beta}| \lesssim 0.7 - 2.8 \text{ eV}$$

FUTURE EXPERIMENTS

COBRA, XMASS, CAMEO, CANDLES

$$|m_{\beta\beta}| \sim \text{few } 10^{-1} \text{ eV}$$

EXO, MOON, Super-NEMO, CUORE, Majorana, GEM, GERDA

$$|m_{\beta\beta}| \sim \text{few } 10^{-2} \text{ eV}$$

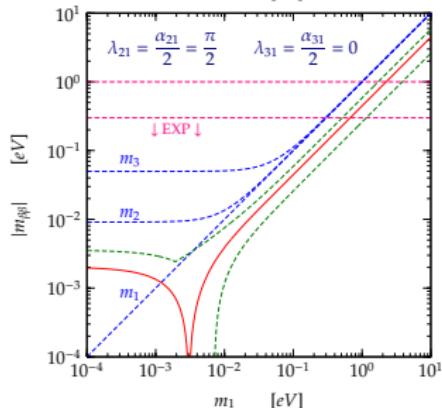

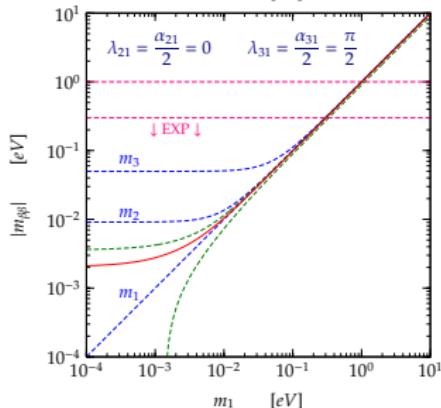

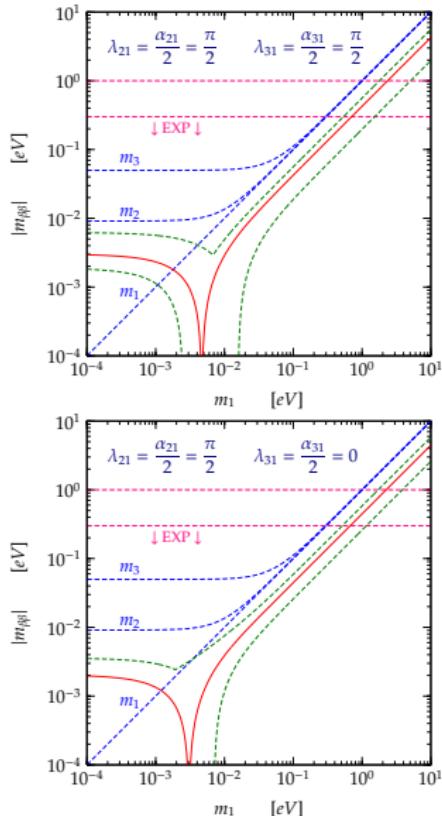

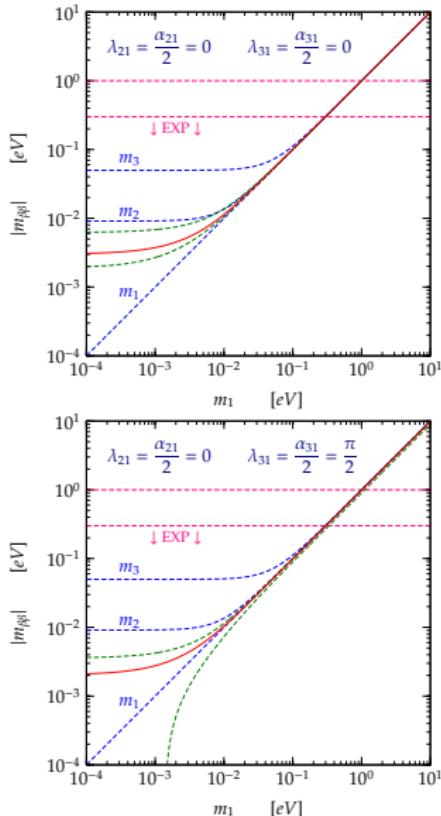

Bounds from Neutrino Oscillations

$$m_{\beta\beta} = |U_{e1}|^2 m_1 + |U_{e2}|^2 e^{i\alpha_{21}} m_2 + |U_{e3}|^2 e^{i\alpha_{31}} m_3$$

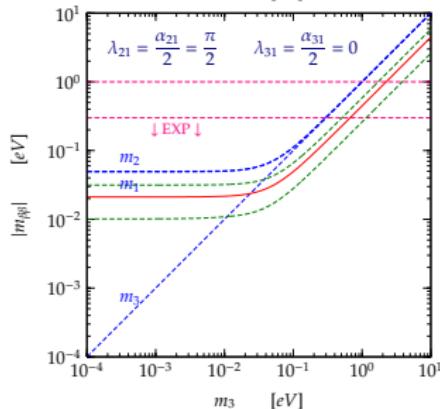

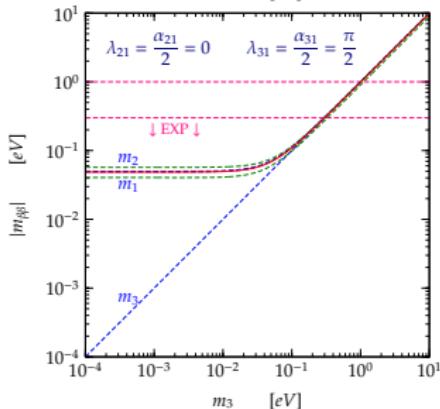

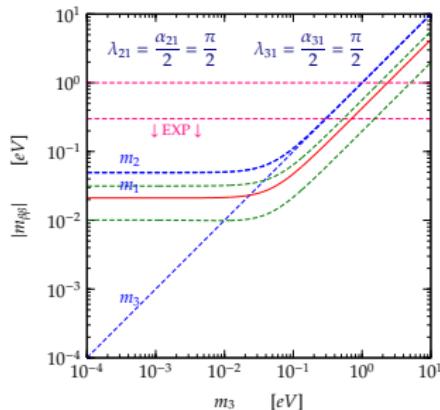

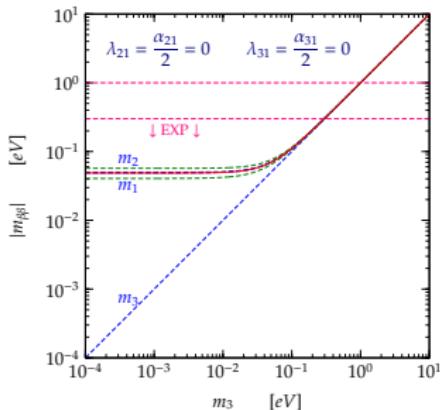

CP conservation

$$\alpha_{21} = 0, \pi \quad \alpha_{31} = 0, \pi$$

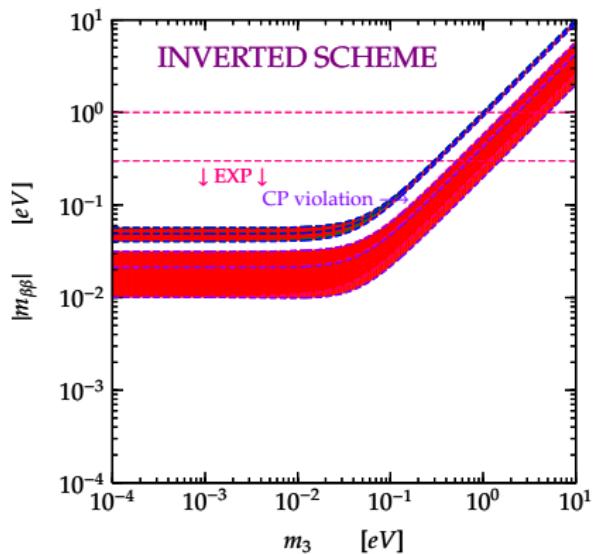

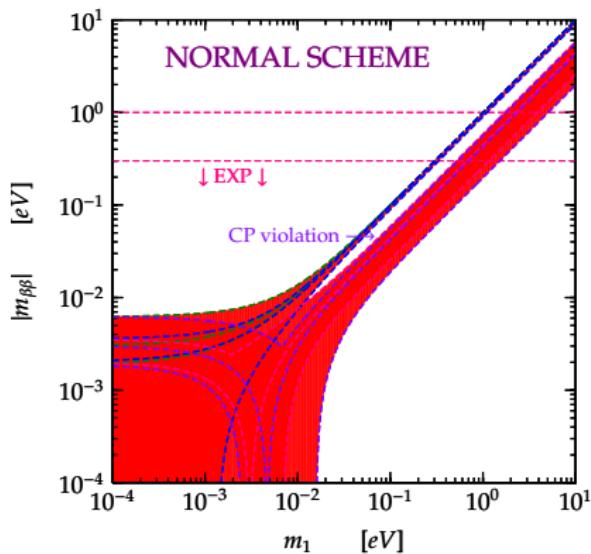

CP Conservation: Normal Scheme

CP Conservation: Inverted Scheme

$$m_{\beta\beta} = |U_{e1}|^2 m_1 + |U_{e2}|^2 e^{i\alpha_{21}} m_2 + |U_{e3}|^2 e^{i\alpha_{31}} m_3$$

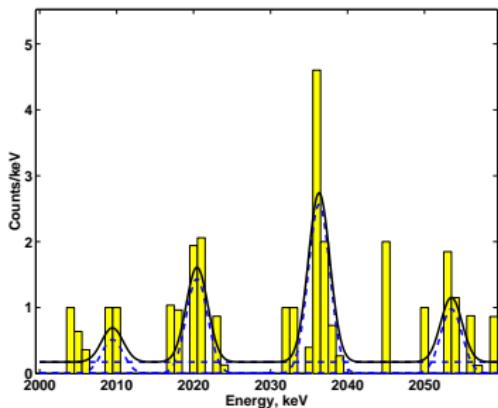

FUTURE: IF $|m_{\beta\beta}| \lesssim 10^{-2}$ eV \implies NORMAL HIERARCHY

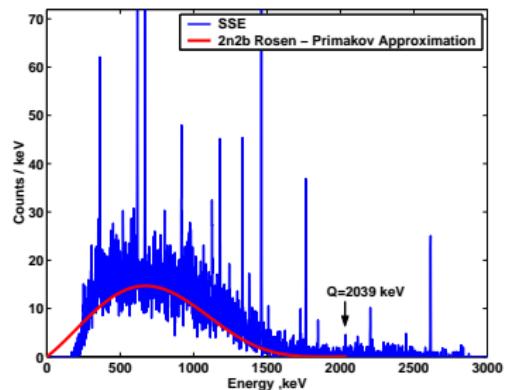

Experimental Positive Indication

[Klapdor et al., MPLA 16 (2001) 2409; FP 32 (2002) 1181; NIMA 522 (2004) 371; PLB 586 (2004) 198]

$$T_{1/2}^{0\nu\text{ bf}} = 1.19 \times 10^{25} \text{ y} \quad T_{1/2}^{0\nu} = (0.69 - 4.18) \times 10^{25} \text{ y} (3\sigma) \quad 4.2\sigma \text{ evidence}$$

pulse-shape selected spectrum

3.8 σ evidence

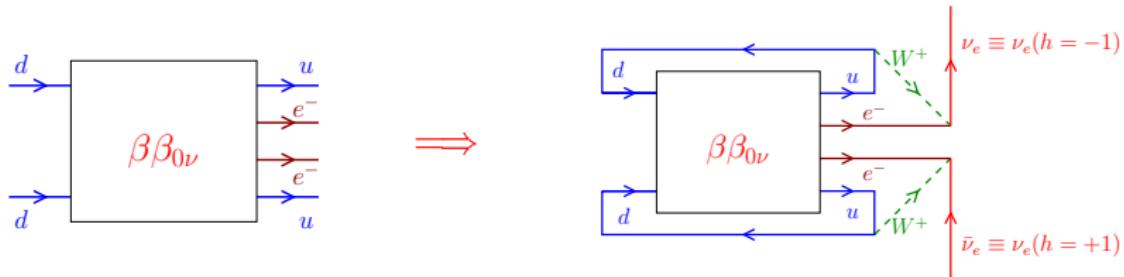

[PLB 586 (2004) 198]

the indication must be checked by other experiments

$$1.35 \lesssim |\mathcal{M}_{0\nu}| \lesssim 4.12 \implies 0.22 \text{ eV} \lesssim |m_{\beta\beta}| \lesssim 1.6 \text{ eV}$$

if confirmed, very exciting (Majorana ν and large mass scale)

$\beta\beta_{0\nu}$ Decay \Leftrightarrow Majorana Neutrino Mass

[Schechter, Valle, PRD 25 (1982) 2951] [Takasugi, PLB 149 (1984) 372]

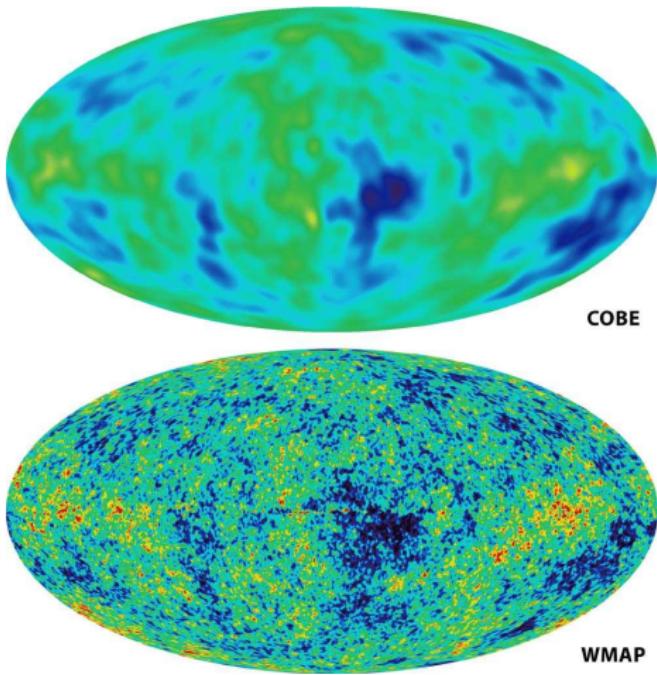

Majorana Mass Term

$$\mathcal{L}_{eL}^M = -\frac{1}{2} m_{ee} \left(\overline{\nu_{eL}^c} \nu_{eL} + \overline{\nu_{eL}} \nu_{eL}^c \right)$$

Conclusions

$\nu_e \rightarrow \nu_\mu, \nu_\tau$ with $\Delta m_{\text{SOL}}^2 \simeq 8.3 \times 10^{-5} \text{ eV}^2$ (SOL, KamLAND)

$\nu_\mu \rightarrow \nu_\tau$ with $\Delta m_{\text{ATM}}^2 \simeq 2.4 \times 10^{-3} \text{ eV}^2$ (ATM, K2K, MINOS)

Bilarge 3ν -Mixing with $|U_{e3}|^2 \ll 1$ (CHOOZ)

β & $\beta\beta_{0\nu}$ Decay and Cosmology $\Rightarrow m_\nu \lesssim 1 \text{ eV}$

FUTURE

Theory: Why lepton mixing \neq quark mixing?

(Due to Majorana nature of ν 's?)

Why only $|U_{e3}|^2 \ll 1$?

Explain experimental neutrino anomalies (sterile ν 's?).

Exp.: Measure $|U_{e3}| > 0 \Rightarrow$ CP viol., matter effects, mass hierarchy.

Check experimental neutrino anomalies.

Check $\beta\beta_{0\nu}$ signal at Quasi-Degenerate mass scale.

Improve β & $\beta\beta_{0\nu}$ Decay and Cosmology measurements.
